^asRNAs were identified as transcripts in RNA-seq studies (>1500 reads) that had no protein coding sequence in any of the 6 reading frames. The orientation of predicted sRNAs was based on a BLAST search of the sRNA database (<http://bioinfo.mikrobio.med.uni-giessen.de/sRNAdb/Blast>), the minimum free energy prediction for the sRNA secondary structure (<http://rna.tbi.univie.ac.at/cgi-bin/RNAfold.cgi>) and the prediction of sRNA promoter location (<http://linux1.softberry.com/berry.phtml?topic=bprom&group=programs&subgroup=gfindb>).

^bOverlaps with annotated ORFs are noted. The nucleotide sequences of the predicted promoters represent the -35 and -10 regions.

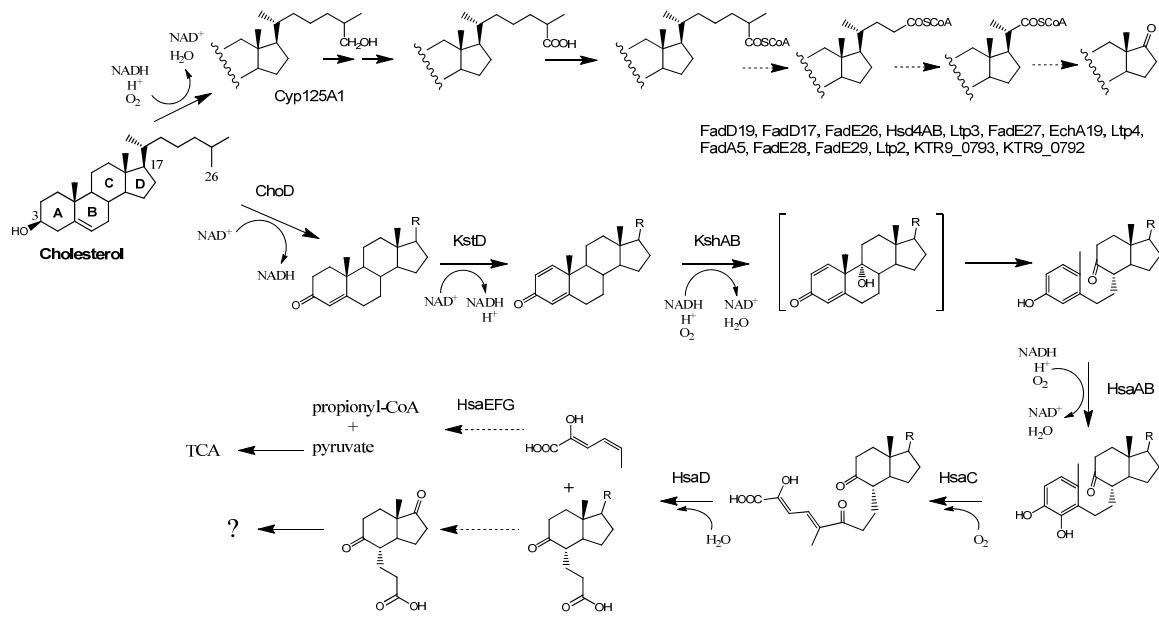

Figure S1. Cholesterol catabolic pathway in KTR9 based on metabolic reconstruction. Dashed arrows represent multiple steps. ChoD is tentatively assigned to the initial transformation of ring A. R can either be a partially degraded side chain containing 3, 5, or 8 carbons, and a CoA moiety, or a keto group. TCA, tricarboxylic acid cycle.

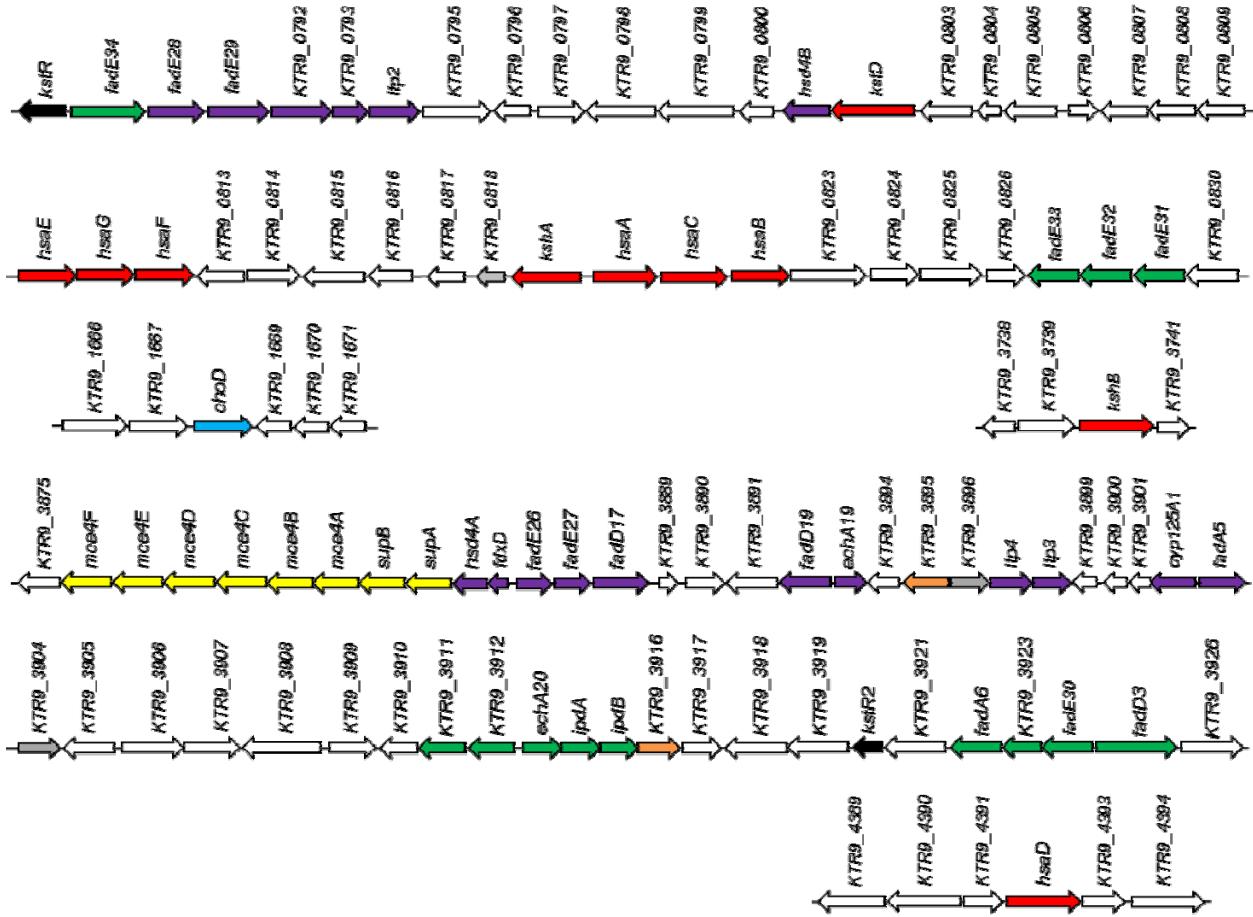

Figure S2. Predicted cholesterol catabolic genes in KTR9. Most of the genes are arranged in two clusters spanning KTR9_0788 to KTR9_0829 and KTR9_3876 to KTR9_3925, respectively. Three other genes occur elsewhere in the genome. Genes are color-coded as follows: red, genes involved in degradation of rings A and B; purple, genes involved in side chain degradation; green, genes involved in degradation of rings C and D; yellow, genes comprising the Mce4 cholesterol importer; black, transcriptional regulator; blue, *choD*, encoding a proposed cholesterol oxidase; orange, encoding oxidoreductases of unknown function conserved in the RHA1 and *Mtb* cholesterol catabolic cluster; grey, encoding conserved hypothetical protein; white, genes of no known function in cholesterol catabolism.
