

Supplemental Figure 1. Orthologs search. The flowchart shows the methodology used to find new orthologous proteins in the family *Baculoviridae*. The boxes with continuous lines indicate the application of the multi Psi-Blast routine, whereas the boxes with dash-dot-dot lines refer to the multi tBlastN/BlastP routines; both are steps contained in the *ad hoc* software. The double line boxes indicate decisions or actions that should be taken by the user. The rectangle with dash-dot line indicates the use of PSI-Coffee web server for making all the alignments; the dotted rectangle represents the HMMER software application for making hidden Markov models; and the dashed boxes refer to the use of the HaMSiR software for remote orthology searching.

Table 1. Baculovirus complete genomes

	Name	Abbreviation	Accession number	Code
<i>Alphabaculovirus</i> (Group I)	<i>Antheraea pernyi</i> NPV-Z	AnpeNPV-Z	NC_008035	APN

This table contains all of the baculoviruses used in bioinformatic studies, sorted by genus (and within them by alphabetical order). MNPV is the abbreviation of multicapsid nucleopolyhedrovirus; NPV is the abbreviation of nucleopolyhedrovirus; SNPV is the abbreviation of single nucleopolyhedrovirus; GV is the abbreviation of granulovirus. The accession numbers are from National Center for Biotechnology Information (NCBI, <http://www.ncbi.nlm.nih.gov>) and correspond to the sequences of complete genomes. Code is a three letter abbreviation used in some pictures.
