Figure S1. Alignment of the amino acid sequences of fifteen *An. funestus* CYP6 P450 proteins from the *rp2* BAC clone. The sequences were aligned using ClustalW. The membrane targeting/anchor hydrophobic N-terminal region is in bold and underlined. The conserved C-helix WxxxR motif is in green while the other conserved ExLR and PERF motifs are highlighted in yellow and grey. The haem-binding loop (P450 signature sequence) is highlighted in dark grey with the cysteine residue involved in haem coordination is in bold and underlined.

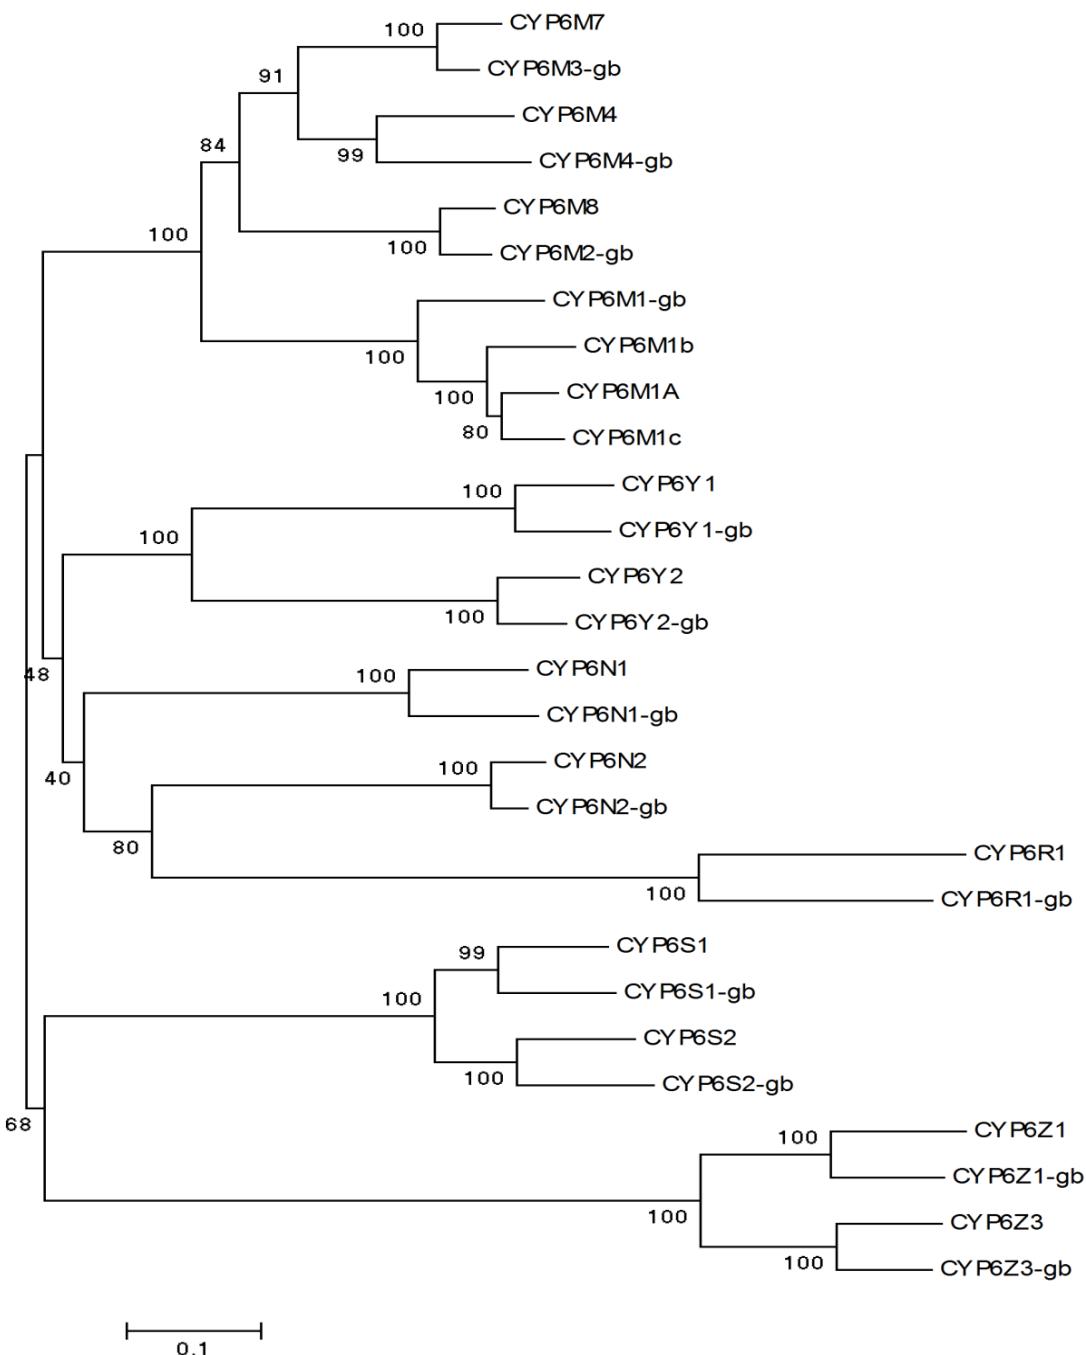

Figure S2: Neighbour joining tree showing the phylogeny of P450 genes from the sequenced BAC clone of *An. funestus* and orthologs in *An. gambiae*. The g letter beside a P450 indicates that it belongs to *An. gambiae*. Genes with a, b and c designation are copies of a triplication event from *CYP6M1* and have not yet been assigned individual gene names.

Figure S3: Amino acid sequence comparison of the three genes orthologs of AgCYP6M1 obtained from the sequencing of the rp2 BAC clone in *An. funestus*. An * (asterisk) indicates positions which have a single, fully conserved residue; A : (colon) indicates conservation between groups of strongly similar properties; A . (period) indicates conservation between groups of weakly similar properties.

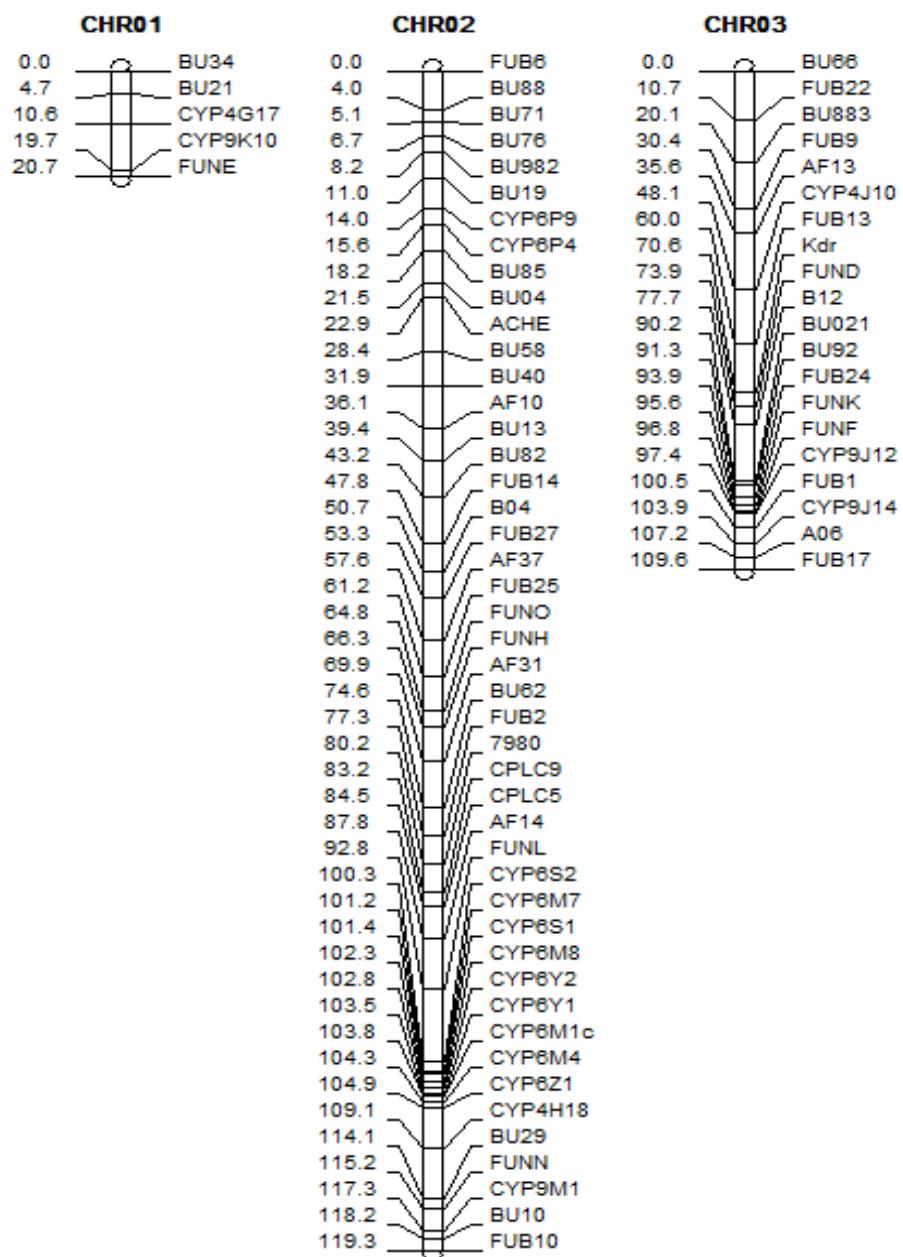

Figure S4: Combined Linkage map of Family 1 ($\text{♀susceptible} \times \text{♂resistant}$) and Family 10 ($\text{♀resistant} \times \text{♂susceptible}$).

Figure S5: Alignment of the amino acid sequences of CYP6Z1 between FANG and FUMOZ-R strains
 Conserved regions are highlighted as in Figure S1. Substrate recognition sites (SRS) are deduced from the *An. gambiae* model (Chiu et al 2008).
