

Figure S1

A) A panel of renal cell carcinoma cell lines is highly sensitive to silencing of JAG2. Four days after transfection with JAG2 siRNAs cell numbers were determined and normalised to non-targeting siRNAs. The embryonic kidney cell line HEK293 was used as a control. B) Silencing of PLK1 and UBB efficiently reduce cell numbers in HEK293 four days after transfection. Cell numbers were normalised to that of non-targeting siRNA. Graphs shows mean \pm SD (n=6). ** p < 0.001
