

Title:

Tomato *SIDREB* gene restricts leaf expansion and internode elongation by down-regulating key genes for gibberellin biosynthesis

Running title: *SIDREB* restricts internode elongation in tomato

Supplementary Figures and Tables

Fig. S1 *SpDREB* expression in response to drought, salt and cold stress factors.

Salt stress was simulated by watering plants with 400 mM NaCl solution, and drought stress was simulated by removing the seedlings from the soil, washed and placed on filter paper under 70% relative humidity at 25 °C. Cold stress was imposed by transferring plants to a growth chamber and holding the plants at 4 °C. All samples were collected at the indicated time points ('h' refers to hours after treatment) from three biological replicates of each treatment. Error bars indicate means \pm SE (n = 3).

Fig. S2 Multiple alignments of the predicted protein sequence of SIDREB and DREBs from other plants.

A. Multiple alignments of the deduced amino acid sequence of SIDREB (cultivated tomato M82) and those of *Vitis vinifera* (VvDREB, F6H3D6), *Solanum tuberosum* (StDREB, G3K514), *Ricinus communis* (RcDREB, B9RQH3), *Populus trichocarpa* (PtDREB, A9PL48), *Malus domestica* (MdDREB, D5L132), *Glycine max* (GmDREB, C9WA60), *Arabidopsis lyrata subsp* (AtDREB, D7M4A2), *Medicago truncatula* (MtDREB, G7IUM6), *Arachis hypogaea* (AhDREB, B4UW60), *Cucumis melo* (CmDREB, Q75UJ6).

B. Alignment of predicted amino acid sequence of SIDREB and SpDREB (wild specie *S. pennellii*) shows substitution of two amino acids.

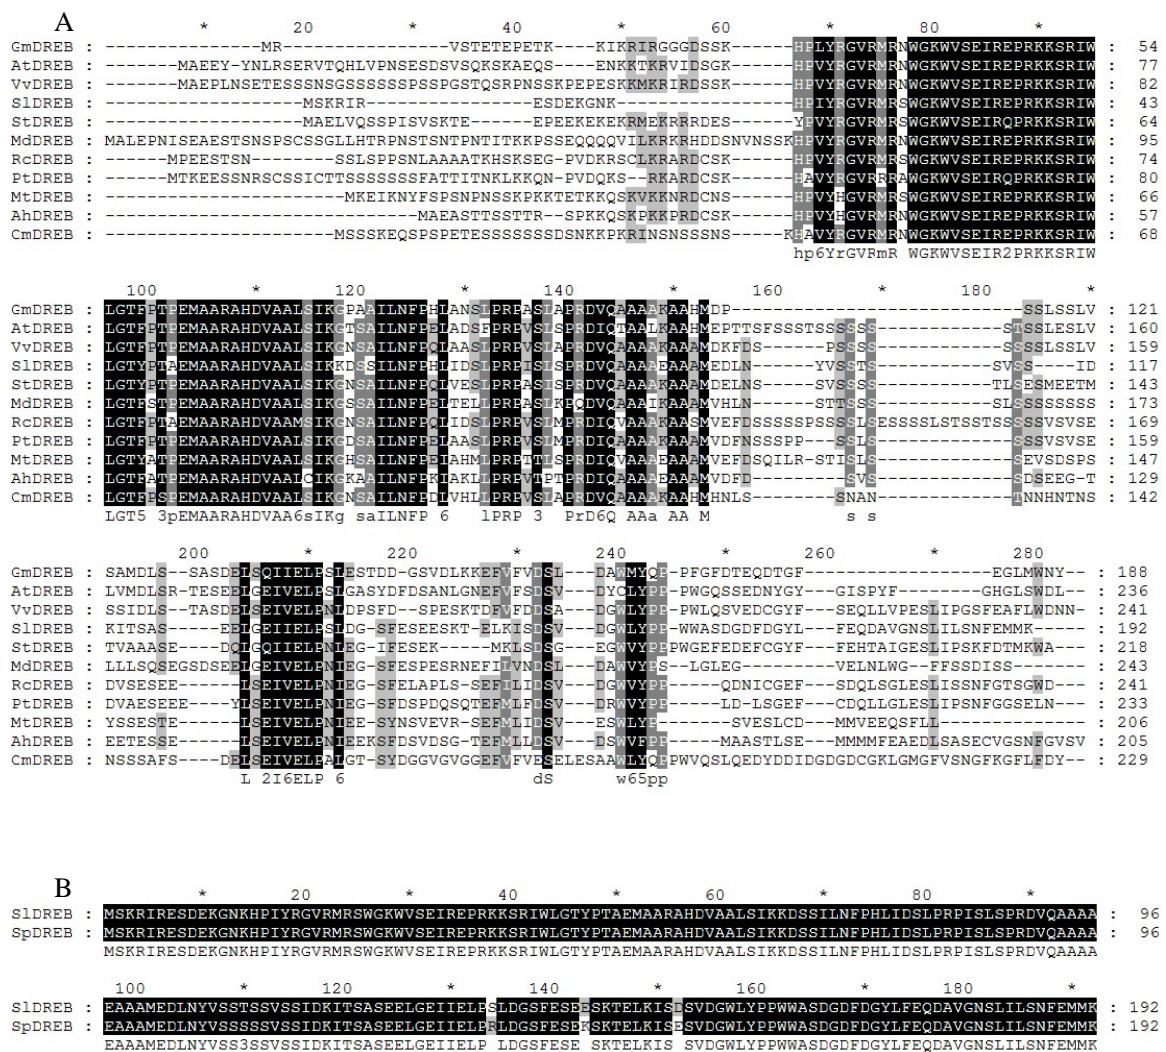

Fig. S3 Sequence of the promoter region of *SICPS*.
