supplemental Figure 1. Phylogenetic tree based on 16S rRNA gene sequences of strain 43P and *Paracoccus* and *Rhodobacter* strains. The tree was drawn using the NJ method with the MEGA5 package. Bootstrap values were calculated from 1000 repeats and those greater than 50% are shown at branch points. The bar represents 0.01 substitution.

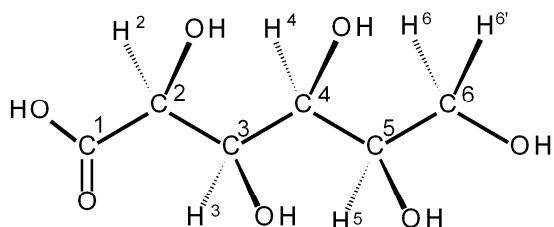

supplemental Figure 2. SDS-PAGE of purification steps of L-GDH (A) and L-GnDH (B) and the purified recombinant enzymes (C). Lanes M denote molecular markers (kDa). (A) Lane 1, cell-free extracts; 2, after DEAE-cellulose; 3, after Butyl-Toyopearl; 4, after Mono Q 5/50 GL; and 5, after Superdex 200 10/300 GL chromatography. (B) Lane 1, cell-free extracts; 2, after first DEAE-cellulose; 3, after second DEAE-cellulose; 4, after Mono Q 5/50 GL; and 5, after Superdex 200 10/300 GL chromatography. The arrow indicates the position of L-GnDH. (C) Lane 1, LgdA; 2, LgnH; 3, LgnI; 4, LgnE; 5, LgnF; and 6, LgnG.

supplemental Figure 3. NMR analysis of LgdA (A), LgnH (B), LgnI (C), and LgnE (D) reaction products. Chemical shifts of the reaction products are shown in tables below, where those of the authentic standards, potassium D-gluconate (A), potassium D-5-keto-gluconate (B), sodium D-idonate (C) and potassium KDGal (D), are shown in brackets. The deduced structures are also shown. All the chemical shifts were referenced to a 4,4-dimethyl-4-silapentane-1-sulfonic acid internal standard (0 ppm).

supplemental Figure 4. PCR analysis of gene disruption mutants. PCR reactions for amplifying *lgdA* (lanes 1 and 2), *lgnE* (3 and 4), *lgnH* (5 and 6), and *lgnI* (7 and 8) were conducted with primer pairs described in supplemental Table 1 using strain 43P chromosomal DNA (lanes 1, 3, 5, and 7), $\Delta lgdA$ strain (2), $\Delta lgnE$ strain (4), $\Delta lgnH$ strain (6), and $\Delta lgnI$ strain (8) as templates. Lane M denotes molecular mass markers.

supplemental Figure 5. Phylogenetic trees based on the amino acid sequences of LgdA (A), LgnH (B), LgnI (C), LgnE (D), LgnF (E), and LgnG (F) and their related sequences from the KEGG genome and Uniprot KB databases. The sequences of enzymes with known function from respective protein families in the Uniprot KB database are shown in green with their accession numbers, and those of "potential" L-glucose and L-gluconate utilizing organisms from the KEGG genome database are shown in red and blue, respectively, with KEGG organisms and accession numbers. The other sequences from the KEGG genome database showing high similarities are indicated only with lines. Line colors denote affiliations of organisms with the KEGG organisms; red, orange, yellow and magenta, *Alpha*-, *Beta*-, *Gamma*- and *Deltaproteobacteria*; green, *Firmicutes*; cyan, *Actinobacteria*; denim, *Chlamydiae*; cream, *Spirochetes*; purple, *Acidobacteria*; blue, *Bacteroidetes*; mustard, *Fusobacteria*; camel, *Verrucomicrobia*; and lilac, Hyperthermophilic bacteria. The bars represent 0.1 substitutions.
