Lipid lowering therapy (%)	1	0	1	2	10	9	12	12

Values are median (interquartile range) or percentage for noncarriers and heterozygotes for S and NS variants. Kruskal-Wallis test with Mann-Whitney U as a post hoc test or Fishers exact test was used for continuous and categorical traits, respectively. LDL cholesterol levels were calculated using the Friedewald equation if triglycerides were  $\leq 4$  mmol/L, but measured directly at higher triglyceride levels. Lipid-lowering therapy was self-reported. <sup>a</sup>P<0.05 and <sup>b</sup>P<0.01 for heterozygotes versus noncarriers.
