

Supplemental Data

Divergent Whole-Genome Methylation Maps of Human and Chimpanzee Brains Reveal Epigenetic Basis of Human Regulatory Evolution

Jia Zeng, Genevieve Konopka, Brendan G. Hunt, Todd M. Preuss, Dan Geschwind, and Soojin V. Yi

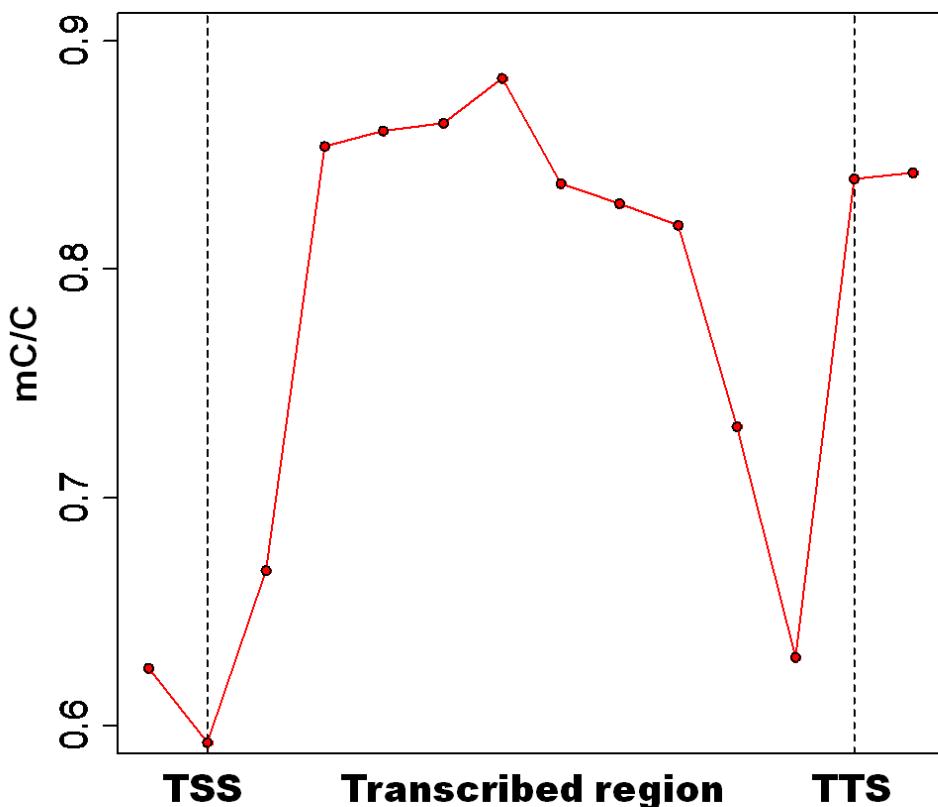

Figure S1. Variation of Methylation Levels in Human Transcription Units

CG methylation profiles along the transcribed region plus 2kb upstream the transcription start site (TSS) and 2kb downstream the transcription end site (TTS). Each point indicates the mean CG methylation level for each equal size bin in the transcribed region or the 1kb interval in the untranslated region.

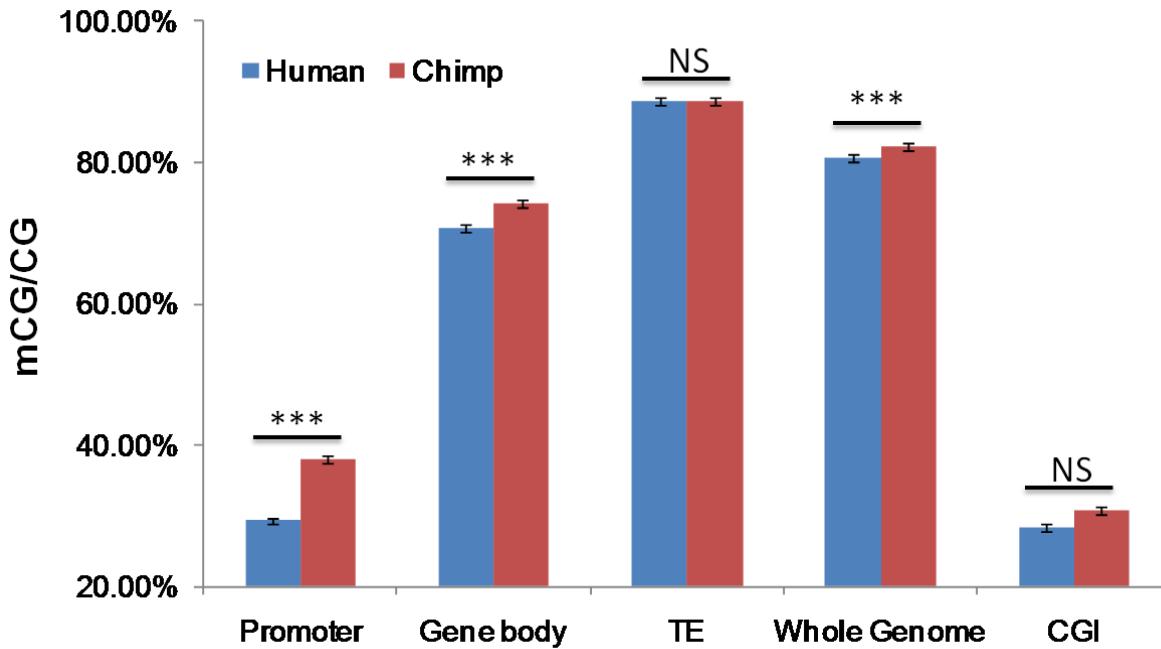

Figure S2. Differences in Fractional Methylation Levels between Human and Chimpanzee Brains

The mean fractional methylation levels (\pm S.E.) of different genomic regions. *** $P < 10^{-15}$, NS: Not Significant, Wilcoxon test. Promoters are the most differentially methylated; human promoters on average exhibit 23% lower methylation relative to chimpanzee promoters (mean mCG/CG levels are 0.293 and 0.381 for human and chimpanzee promoters, respectively. The difference is $(0.381 - 0.293) / 0.381 = 23\%$). Interestingly, TEs still exhibit similar, high levels of DNA methylation, which is in line with a strong silencing effect.

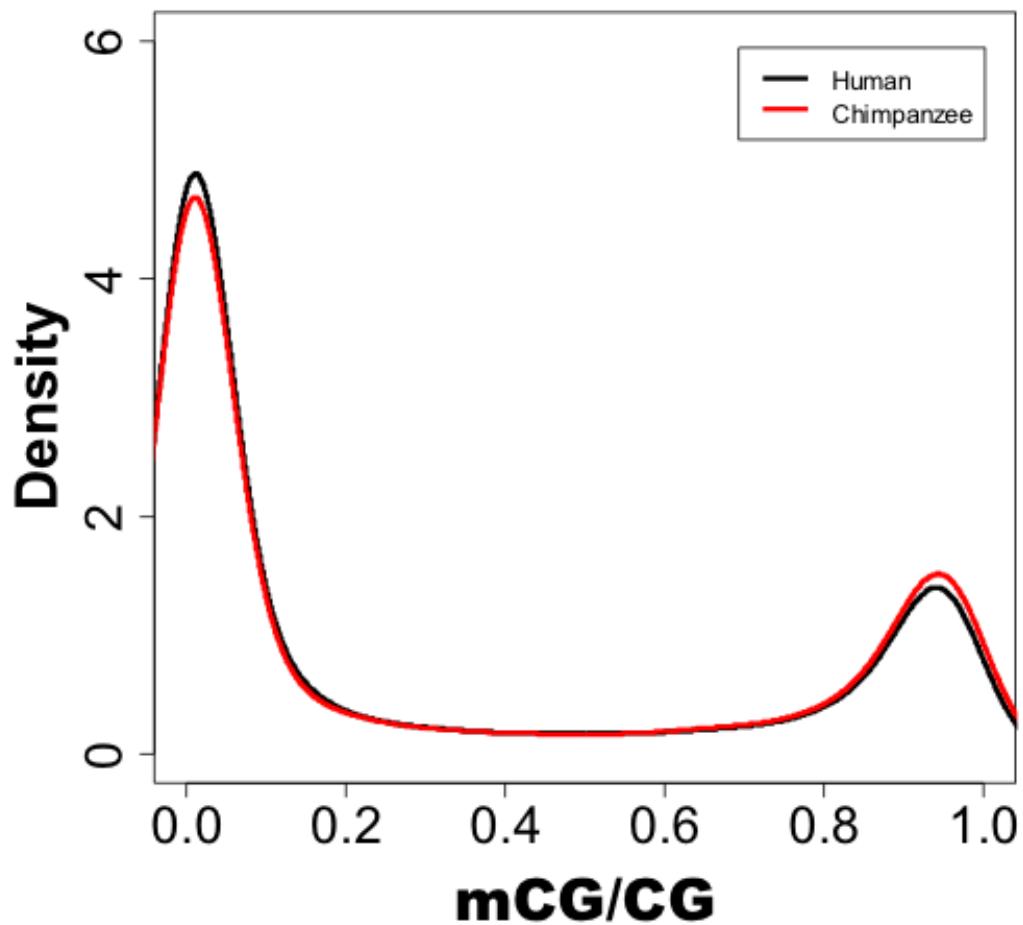

Figure S3. Density Distributions of Human and Chimpanzee CpG Island Fractional Methylation Levels

CpG islands exhibit no evidence of differential methylation between human and chimpanzee genomes (Wilcoxon test, $P = 0.2327$).

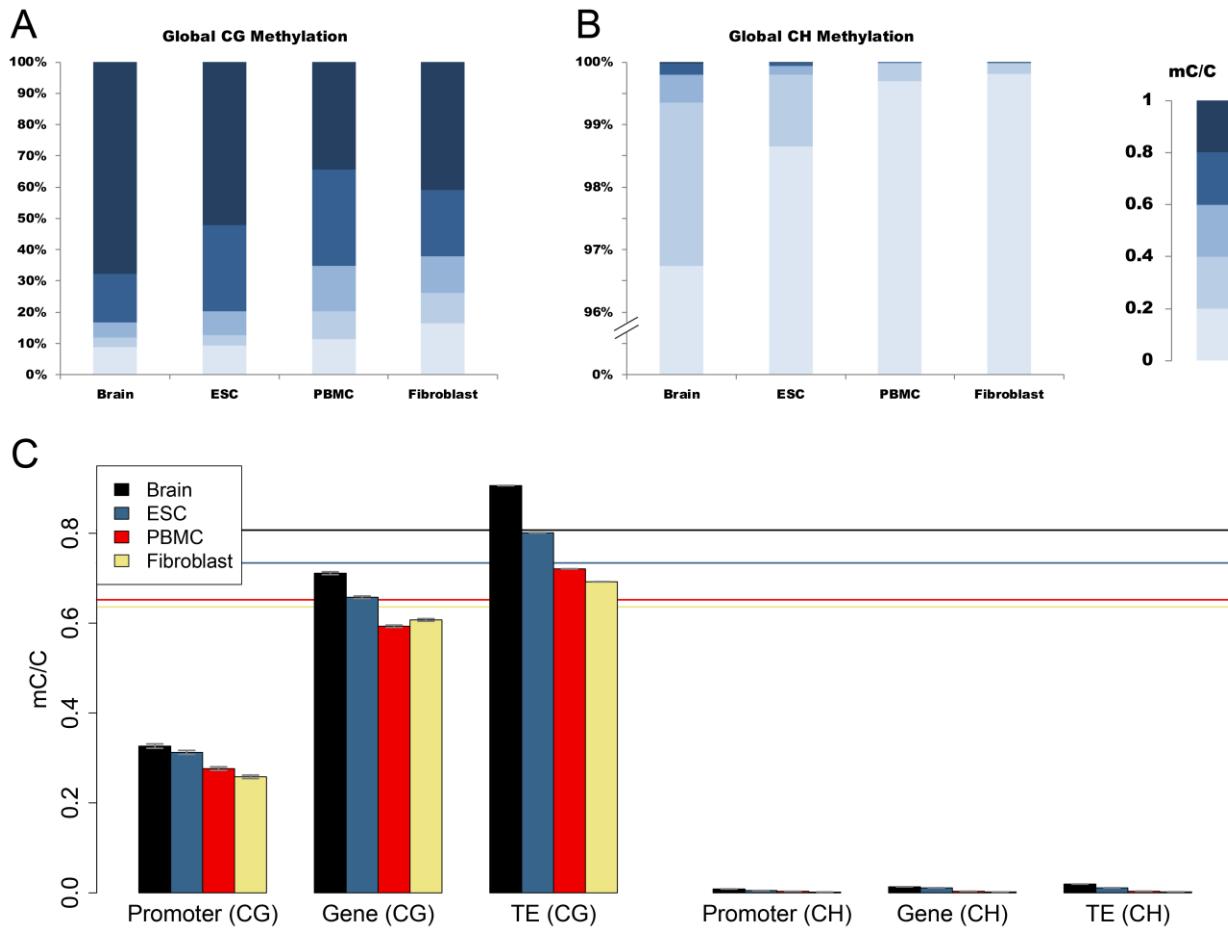

Figure S4. Differences in DNA Methylation Levels among Human Tissues and Genomic Features, after Removing Duplicate Reads from Brain Sample

(A) Proportional representation of genome-wide DNA methylation levels for individual CG dinucleotides in human prefrontal cortex (brain), embryonic stem cells (ESC), neonatal fibroblasts (fibroblast), and peripheral blood mononuclear cells (PBMC).

(B) Same analyses as in (A), but for CH dinucleotide context ($H = A, T$, or C).

(C) Mean methylation levels in each tissue for gene promoters (CG context $N = 18,368$, CH context $N = 18,566$), gene bodies (CG context $N = 18,454$, CH context $N = 18,640$), and transposable elements (CG context $N = 1,763,067$, CH context $N = 2,919,957$). Horizontal lines indicate global means of methylation levels for individual CG sites. Error bars, 95% confidence intervals of the mean.

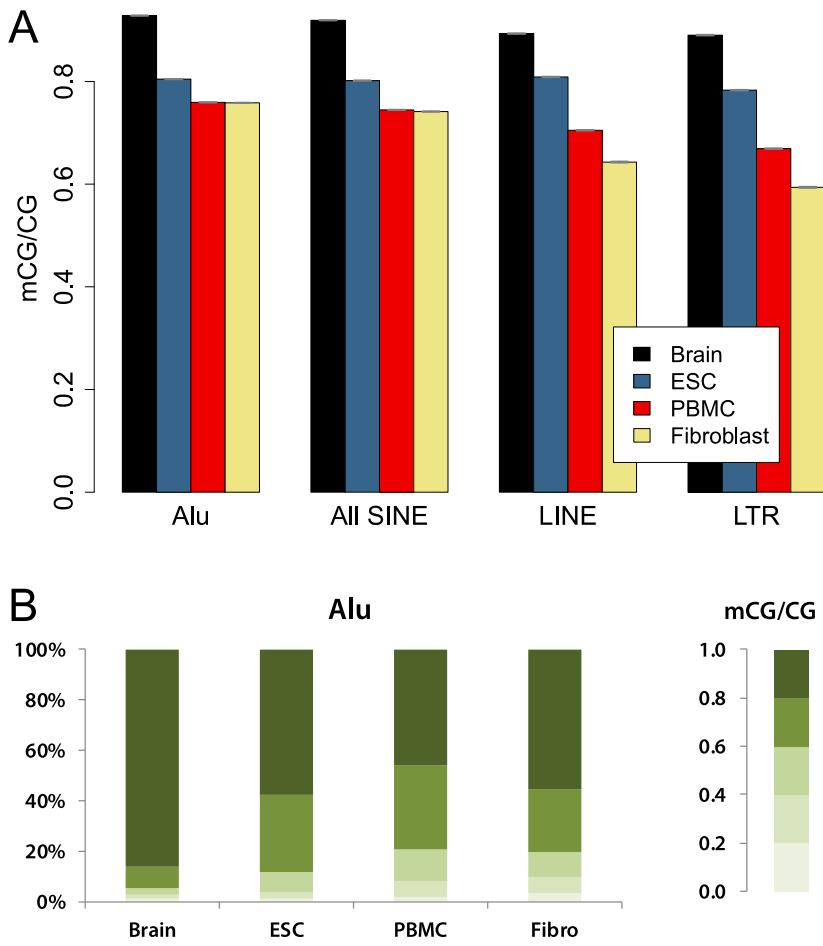

Figure S5. Differences in DNA Methylation Levels for Transposable Element Classes among Human Tissues

(A) Mean CG methylation levels in human prefrontal cortex (brain), embryonic stem cells (ESC), neonatal fibroblasts (fibroblast), and peripheral blood mononuclear cells (PBMC) for the following classes of transposable elements as identified by RepeatMasker: Alu elements ($N = 881,311$), all short interspersed elements including Alu (All SINE; $N = 1,043,521$), long interspersed elements (LINE; $N = 370,983$), and long terminal repeats (LTR; $N = 291,925$).

(B) Proportional representation of mean CG methylation levels for each Alu element.

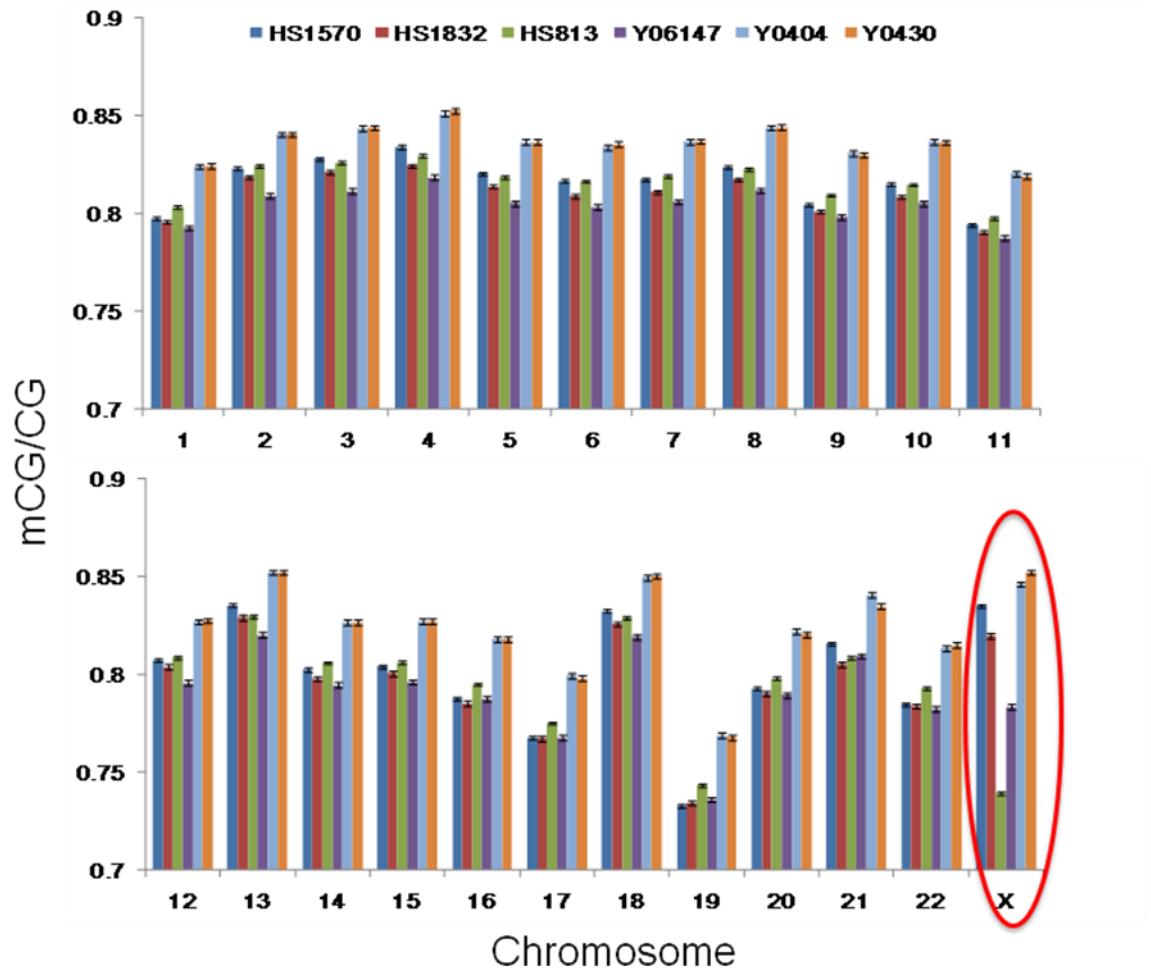

Figure S6. Chromosome-wide Variation of DNA Methylation in Human and Chimpanzee Individuals

The X chromosome is notably hypomethylated in the female sample (Hs813).

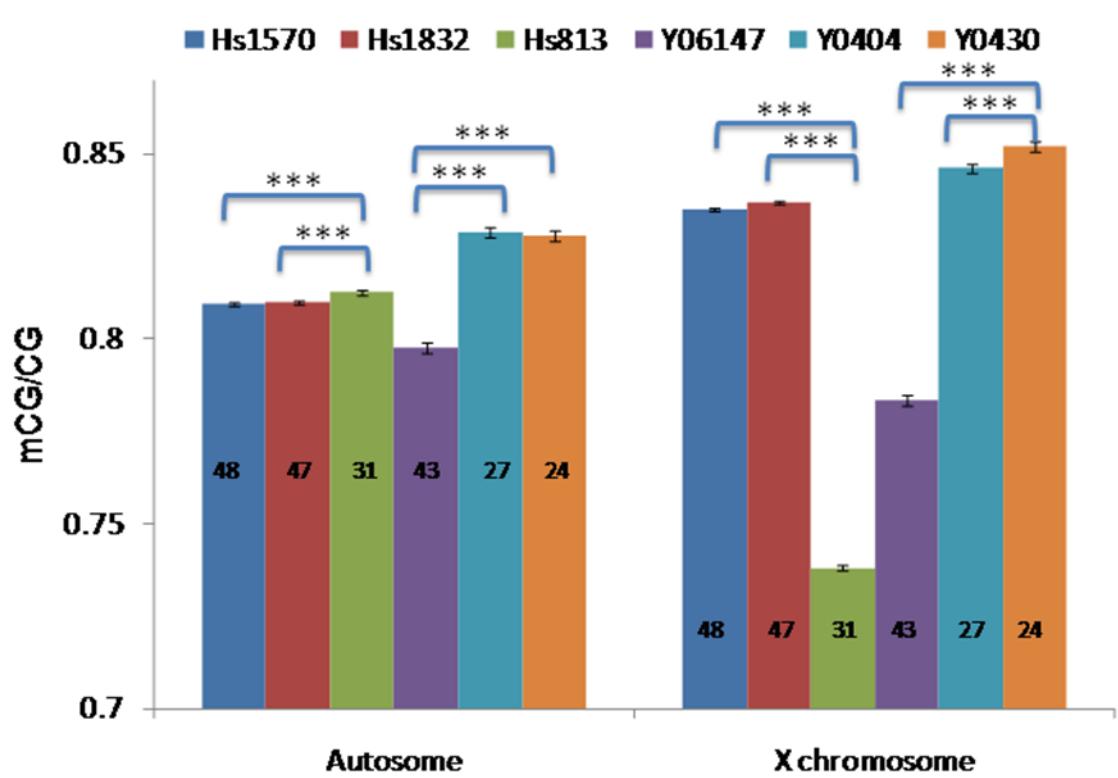

Figure S7. DNA Methylation Level (\pm S.E.) in Autosomes and the X Chromosomes between Human and Chimpanzee Samples

*** $P < 10^{-15}$, Wilcoxon test. The age of each individual are shown within each bar plot. The X chromosome is notably hypomethylated in the female individual (Hs813).

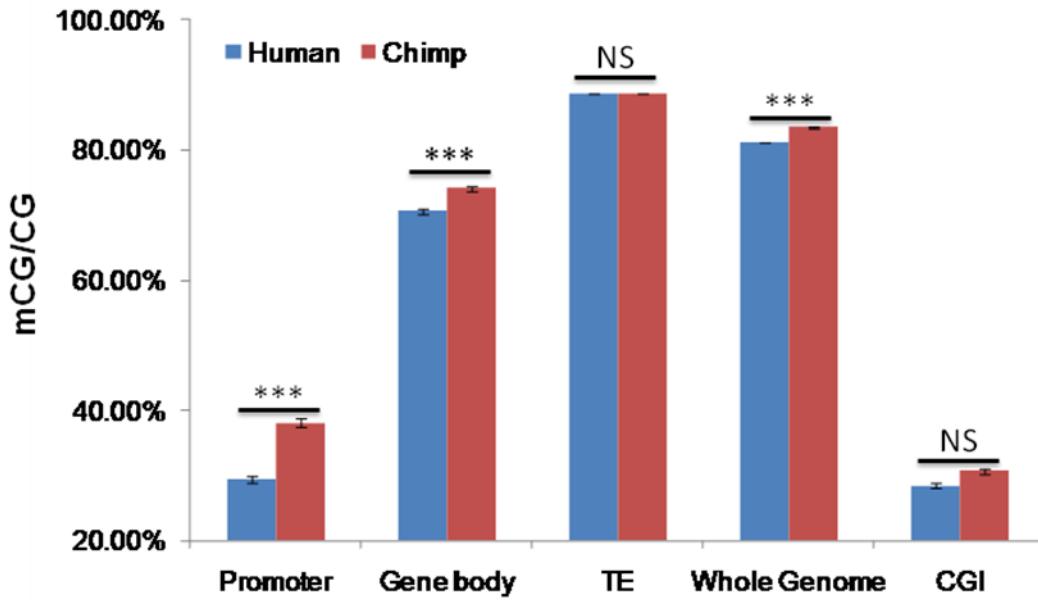

Figure S8. Differences in Fractional Methylation Levels between Human and Chimpanzee Brains, When Only Autosomal Data Are Used

The mean fractional methylation levels (\pm S.E.) of different genomic regions. *** $P < 10^{-15}$, NS: Not Significant.

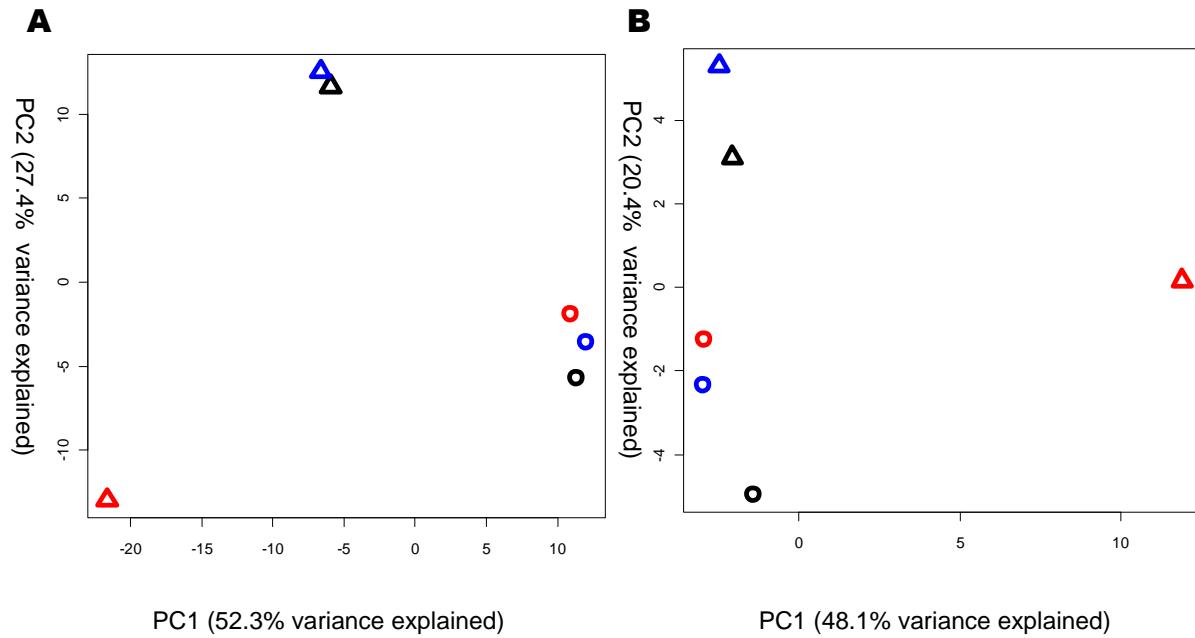

Figure S9. Variation of Genomic DNA Methylation in the Human Brains ($n = 3$) and in the Chimpanzee Brains ($n = 3$), after Removing Orthologs in X Chromosome

Principal component analysis of six methylation profiles, at both of the promoter (A) and gene body (B). PC1 and PC2, together with their explained variation, are plotted on the x-axis and y-axis, respectively. The first principal component, which explains 52.3% and 48.1% of variation in promoter and gene body respectively, separates two human samples from the third one. The second principal component, explaining 27.4% and 20.4% of total variation in promoter and gene body respectively, distinguishes samples from human and chimpanzees.

Table S1. Descriptions of Six Individuals Used for Methylation Analyses

Species	ID	Age	Sex	Cause of Death	Numbers of Total Reads ($\times 10^6$)
Human	Hs1570	48	Male	Accident	354.9
Human	Hs1832	47	Male	Cardiovascular disease	327.1
Human	Hs813	31	Female	Accident	343.1
Chimpanzee	Y06147	43	Male	Congestive heart failure	309.0
Chimpanzee	Y0404	27	Male	Cardiac fibrosis	391.4
Chimpanzee	Y0430	24	Male	Myocardial fibrosis	331.2

Table S2. Human and Chimpanzee Samples Used for Expression Analyses

Sample	Age	Sex	PMI	RIN	Identifier	Cause of Death
<i>Homo sapiens</i>						
Hs_FP_1	31	F	14	7.9	813	Accident
Hs_FP_2	40	M	7	7.2	1903	Cardiovascular disease
Hs_FP_3	30	M	12	6.8	1029	Accident
Hs_FP_4	20	F	4	6.8	4548	Injuries from motor vehicle accident
Hs_FP_5	45	M	6	7.2	4598	Dilated cardiomyopathy
Hs_FP_6	42	M	15	6.8	1134	Cardiovascular disease
<i>Pan troglodytes</i>						
Pt_FP_1	18	M	3	7.6	Y07.147	Cardiac fibrosis
Pt_FP_2	27	M	0.5	5.1	Y04.04	Cardiac fibrosis
Pt_FP_3	43	M	2.5	4.3	Y06.147	Myocardial fibrosis
Pt_FP_4	21	M	13	4.5	Y03.09	Liver failure
Pt_FP_5	44	F	0.5	3.1	Y06.108	Atherosclerosis
Pt_FP_6	28	M	3	4.1	Y05.12	Cardiac fibrosis

PMI=post mortem interval in hours; Age is in years

RIN=RNA integrity number

Table S3. Comparison of CpG Methylation from Enard et al [8]

Gene	Human Coordinate	Human mCG/C _G (Total # of reads)	Chimp coordinate	Chimpanzee mCG/C _G (Total # of Reads)

All the individual CpG site in the following table are reported to be significantly differentially methylated between human and chimpanzee according to Enard et al [8]. The mCG/C_G values are calculated based on all the 3 individuals in human or chimpanzee from our data.

Table S4. 468 Genes for which the Human Promoters Exhibit Hypomethylation compared to the Chimpanzee Promoters

Human_FM and Chimp_FM refer to the fractional methylation levels in the human and chimpanzees, respectively.

Table S5. Six Genes for which the Human Promoters Exhibit Hypermethylation Compared to the Chimpanzee Promoters

Gene	Human_FM	Chimp_FM
NM_000413	0.9023	0.1951
NM_001638	0.9813	0.0090
NM_001872	0.9259	0.0137
NM_003493	0.9848	0.1450
NM_005435	1	0.1334
NM_145064	0.8191	0.0350

Table S6. Genes Whose Promoters Are Differentially Methylated between the Human and Chimpanzee Brains Using the Second Criterion (n = 1055) Are Enriched in Similar Gene Ontology (GO) Terms as the First Set

GO Terms	Accession	p Value (FDR)
cellular process	GO:0009987	7.4e-12
protein binding	GO:0005515	1.7e-09
cellular macromolecule metabolic process	GO:0044260	2.1e-07
cellular metabolic process	GO:0044237	3.3e-07
catalytic activity	GO:0003824	1.5e-06

Table S7. Genes Whose Promoters Are Differentially Methylated between the Human and Chimpanzee Brains Using the Second Criterion (n = 1,055) Are Also Associated with Neurological Diseases, Psychological Disorders, and Cancers.

Category	Count	Fold Enrichment	Genes
cocaine abuse	3	6.2	NM_001045, NM_004898, NM_002616
