

SUPPLEMENTARY MATERIAL

MATERIALS AND METHODS

DNA sequencing

We performed amplicon sequencing of *HLA-A* exons 2, 3, and 4 of *HLA-A*, which contain the sequence variations that define (Bjorkman et al., 1987; Parham et al., 1988) in 20 unrelated EUR GV patients, on the 454 Life Science GS FLX as previously described (Bentley et al., 2009; Holcomb et al., 2011), except that the GS GType *HLA* HR primers (Roche Applied Science, Indianapolis) were used. The accompanying protocol for GS Titanium Sequencing was followed, except that 0.5 copies of DNA per bead were used and 70% of the recommended amount of DNA beads was loaded on the PicoTiter Plate™. *HLA* genotypes were assigned using Conexio Assign ATF 454 software v34 (Conexio Genomics, Perth, Australia), customized to include data from intronic sequences and International Immunogenetics Information System (<http://www.imgt.org>) 3.1.0 2010-07-16 references.

We sequenced a total 10.4 kb of the *TYR* region of chromosome 11q14.3 in 114 unrelated EUR GV patients, six of whom were among those sequenced for *HLA-A*, who were probands of multiplex GV families that also segregated other autoimmune diseases. Primers were designed using Primer3 (<http://primer3.sourceforge.net/webif.php>), amplifying 30 PCR products sized 200 to 600 bp (Supplementary Table 5), spanning all five exons: 2375 nt of 5' promoter, exon 1, through 282 nt 3'; a 332 nt internal portion of IVS1; exon 2 flanked by 70 nt 5' and 305 nt 3'; a 401 nt internal portion of IVS2; exon 3 flanked by 165 nt 5' and 229 nt 3'; exon 4 flanked by 110 nt 5' and 250 nt 3'; and exon 5 flanked by 180 nt 5' and 3242 nt 3'. For

each patient, 5 µg genomic DNA was sheared to 2-4 kb, and 1.5 µg was used for microdroplet multiplex PCR utilizing the RDT-1000 (RainDance Technologies). Amplicon DNA was purified, blunt-end concatenated, purified, sonicated, end-repaired, A-tailed, and was ligated to modified Amplicon DNA Illumina Solexa™ adapter oligonucleotides containing unique 7-nt multiplexing barcodes, resistant to two sequencing errors in the barcodes (Hamady *et al.*, 2008). Amplicon DNA fragments were then electrophoresed in 3% agarose-TBE, extracted from a band corresponding to 250-300 bp, amplified by Solexa PCR, and re-purified. Size and concentration of the resultant DNA libraries were analyzed using the Agilent Bioanalyzer DNA 7500 kit before sequencing on an Illumina Genome Analyzer IIx using 69-nt reads (Hittinger *et al.*, 2010).

Bioinformatic analyses

Illumina Pipeline software produced FASTQ sequence files, which were parsed by individual using custom software capable of correcting up to two mutations per barcode. Reads were aligned to human genome build GRCh37.1/hg19 using GSNAp, ver. 2010-07-27 (Wu and Nacu, 2010). Reads that mapped to no more than 10 genomic locations were then aligned to the target sequence with the requirement that they map uniquely. Custom software converted GSNAp output to individual SNP or indel genotypes at locations with \geq 10X coverage. All variants called were submitted to SeattleSeq Annotation (snp.gs.washington.edu/SeattleSeqAnnotation131) and FuncPred (<http://snpinfo.niehs.nih.gov/snfunc.htm>) to rank potential deleterious effects. PolyPhen-2 (<http://genetics.bwh.harvard.edu/pph2>) and SIFT (<http://sift.jcvi.org>) were

used to further assess non-synonymous SNPs and indels, respectively, and SKIPPY (Woolfe *et al.*, 2010) was used to assess possible effects of variants on RNA splicing. Variants 5' and 3' to the gene were screened for localization to potential regulatory elements using the ENCODE Regulation, ENC DNA methyl, TFBS Conserved, TS miRNA sites, ORegAnno, Vista Enhancers, CD34 DNasel, and CpG Islands tracks implemented in the UCSC Genome Browser (<http://genome.ucsc.edu/cgi-bin/hgGateway>).

Statistical analyses

Statistical analyses were carried out using data from the previous genomewide screen of 1392 GV cases and 2629 controls (Jin *et al.*, 2010a). We imputed SNP genotypes for a 334 kb region (chr11:88,731,228-89,065,017) spanning the *TYR* gene, from 180 kb upstream and 36 kb downstream, using MaCH (Li *et al.*, 2006), ver.1.0 (<http://www.sph.umich.edu/csg/abecasis/MACH/download/>) based on patterns of haplotype variation in the 1000 Genome Project EUR samples (Release Aug 4, 2010; <http://www.sph.umich.edu/csg/abecasis/MACH/download/1000G-2010-08.html>). We kept the imputed SNPs with $r^2 > 0.3$ for further analyses, which included 651 SNPs with MAF ≥ 0.01 . We also imputed missing genotypes for the 45 genotyped SNPs in the region. Dosage data (posterior genotype probabilities) for each SNP were analyzed by logistic regression analysis implemented in PLINK (Purcell *et al.*, 2007).

To assess the joint effects of S192Y and R402Q on GV susceptibility, we used the corresponding two SNPs, rs1042602 and rs1126809, to define haplotypes and used the E-M Algorithm to estimate the most likely haplotypes for each individual. We

established the best-fit model for the two-SNP haplotypes on the basis of likelihood ratio test statistics by comparing a full model including the additive effects of each haplotype (coded 0, 1 and 2 for the number of copies of each haplotype) and dominance effects (coded 1 for possessing 1 copy of a haplotype, and otherwise 0) with a model including only the additive effects of each haplotype. The additive effect of the ancestral C-G haplotype was used as the reference and thus was not included in the model.

*The allelic typing system does not distinguish between the common *HLA-A*02:01:01:01* allele and the very rare *HLA-A*02:01:01:02L* allele. Although it is likely all of these are *HLA-A*02:01:01:01*, in the text we discuss these alleles using standard 4-digit (non-synonymous changes) nomenclature, represented as *HLA-A*02:01*.

Supplementary Table 2. TYR Sequence Variants Observed in 114 Unrelated Generalized Vitiligo Probands

Ref, reference sequence; Var, variant; AA, amino acid change for non-synonymous variants. x denotes heterozygous and xx indicates homozygous for indicated variant. Gray boxes indicate nucleotides for which calls could not be determined with certainty in specific individuals.

Supplementary Table 3. Model selection for *TYR* rs1042602-rs1126809 haplotypes

	A _{A-A} ¹	A _{C-A} ¹	A _{A-G} ¹	D _{A-A} D _{C-A} ²	D _{C-A} D _{A-G} ²	D _{C-A} D _{C-G} ²	D _{A-G} D _{C-G} ²	df	AIC	Overall P
