

Add.File 3 Tumor exosomes and expression of signal transduction molecules in spleen cells SC were cultured for 48h in the presence of IL2 or ASML-lysate with/without ASML-exosomes. Expression of molecules involved in (A) anti-apoptotic signaling and (B) TCR activation was evaluated by flow-cytometry: Mean percent \pm SD (3 experiments) of stained cells; Significant differences in the presence of ASML-exosomes: *.
