

Supplemental Figure 1. ER β able to mediate glucocorticoid-induced GILZ expression. A) GILZ mRNA was quantified 6 h following treatment with vehicle, 100 nM Dex, 1 μ M Liq or 100 nM Dex and 1 μ M Liq by QRT-PCR. Values were normalized to the housekeeping gene Cyclophilin B. Bar graphs show mean \pm SEM. The symbols represent values that are statistically different at $p < 0.01$ from one another as determined by Tukey's post-hoc analysis following ANOVA. B) GILZ expression was determined by QRT-PCR in ECC1 cells co-treated in the presence or absence of 150 nM PHTPP and vehicle, 100 nM Dex, 10 nM E₂, or 100 nM Dex and 10 nM E₂ for 6 h. Values were normalized to the housekeeping gene Cyclophilin B. Bar graphs show mean \pm SEM. * $p < 0.05$ as determined by ANOVA.
