**Supplementary Figure 1:** Alignments of putative amino acid translations of selected sequences from clades CERV1 (a) and CERV2 (b). Conserved retroviral motifs are bound by black boxes. The dark and light shaded boxes in (b) highlight the proposed sub-lineages within clade CERV2: the unshaded sequences are group CERV2a, dark grey are CERV2b, and lighter grey are CERV2c.

**Supplementary Figure 2:** Neighbour joining trees based on the nucleotide alignments of *C. porosus* sequences from the CERV1 (a) and CERV2 (b) clades. Outgroups are human ERV sequences extracted from the Repbase database and from the same general ERV classes as these sequences. Numbers outside the circles indicate the haplotypes included in each tree. Smaller numbers within the circle represent bootstrap support values greater than 50%.

## Supplementary Tables
