

FIG S1 Positions of the analysed clade 2 strains in a phylogenetic tree constructed based on MLST data (7). Boxes reflect the differences in PBMC cytokine profile upon stimulation with *C. albicans* cells grown on glucose or lactate. Green boxes represent strains that behave similarly to the RM1000 strain and show increased production of (A) IL-10 and decreased levels of (B) IL-17 upon growth on lactate, while black boxes mark strains showing no significant difference between cells grown on glucose or lactate, based on $P < 0.05$. None of the strains tested displayed opposite phenotypes.
