

SUPPLEMENTARY DATA

FIG. S1. Unrooted UPGMA tree constructed using Euclidian genetic distances (Rogers, 1972), based on 13 microsatellite markers, to show the genetic relationships among 81 African and Indian Ocean *Coffea* populations. The tree was obtained from 500 bootstrap iterations. Key: West and West-Central Africa (W/WCA) = pink; East Africa (EA) = green; Madagascar (MAD = dark blue; Mascarenes including the Comoros (MAS) = black. Species/population names are according to the Appendix in the text.

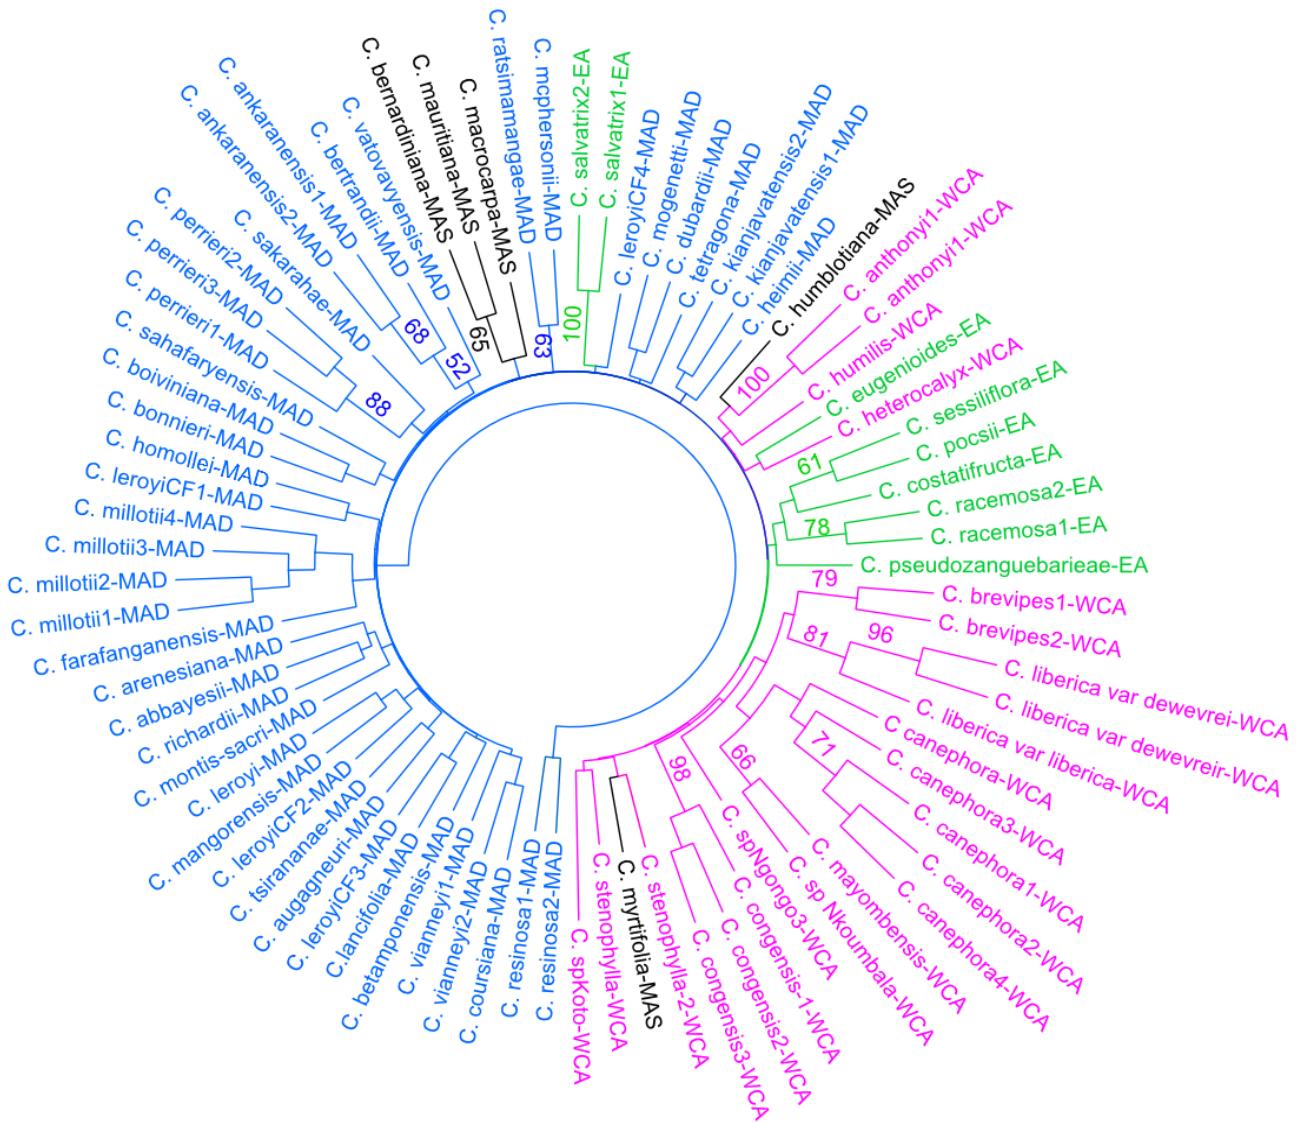

FIG. S2. Relationship between K -value and delta- K by (A, B) regions and (C–H) sub-regions. The delta- K value was calculated according to Evanno *et al.* (2005). The best K -value is given by the highest delta- K value.

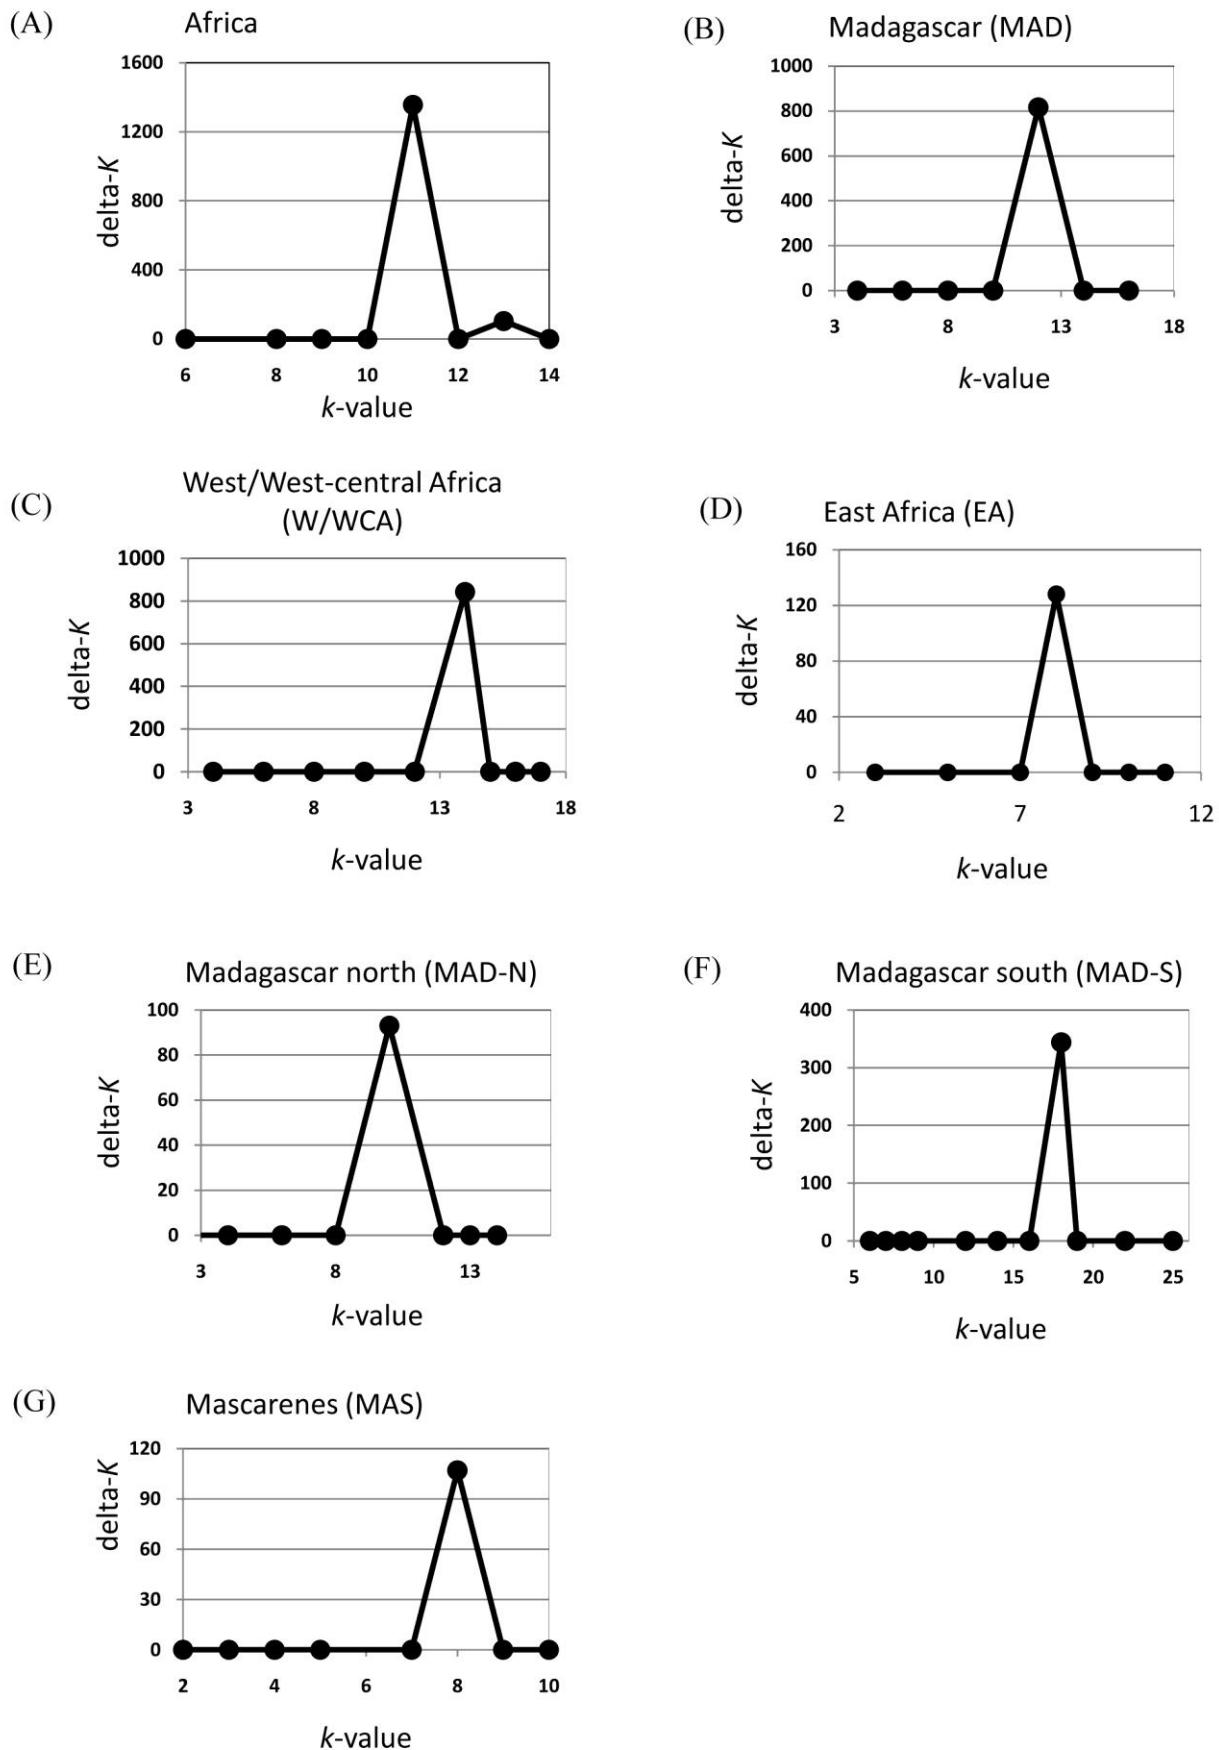

TABLE S1. Species' genetic parameters for each region or sub-region. $A_{N,\text{Total}}$: total number of alleles; A_N : number of alleles; $A_{N,e}$: efficient alleles; H_o : observed heterozygosity; H_e : expected heterozygosity; rb : null alleles. Regions and sub-regions: West and West-Central Africa (W/WCA); East Africa (EA); Indian Ocean Island Madagascar north (IOI: MAD-N); Indian Ocean Island Madagascar south (IOI: MAD-S); Indian Ocean Island Mascarenes (IOI:MAS).

Species	Region/sub-region	$A_{N,\text{Total}}$	A_N	$A_{N,e}$	H_o	H_e	F	rb
