**Figure S1.** Blank (uninjected) oocytes have negligible current responses. (A–D) Two-electrode voltage-clamp recordings of currents from hERG (A and B) and blank oocytes (C and D). Currents were elicited using the pulse protocols shown. Calibration bars, 1  $\mu$ A and 50 ms for the ramp currents in A and C, and 1  $\mu$ A and 200 ms for the family of currents in B and D.
