

Figure S1: Scanning electron microscopy of *Caulobacter crescentus* after shut-down of BamD expression. To assess the phenotype of *C. crescentus* after depletion of BamD, we constructed a strain with BamD under the control of a xylose-inducible promoter (see Methods). The strain is viable on medium containing xylose, but inviable when xylose is absent from the growth medium, demonstrating that the *bamD* gene is essential in *C. crescentus*. Scanning electron microscopy was used to monitor the depletion of BamD after shifting the strain from growth medium containing 0.03% (w/v) xylose to medium containing 0.2% (w/v) glucose: depletion of BamD resulted in drastic changes to the surface of *C. crescentus*. Scale bars represent 1 μm.

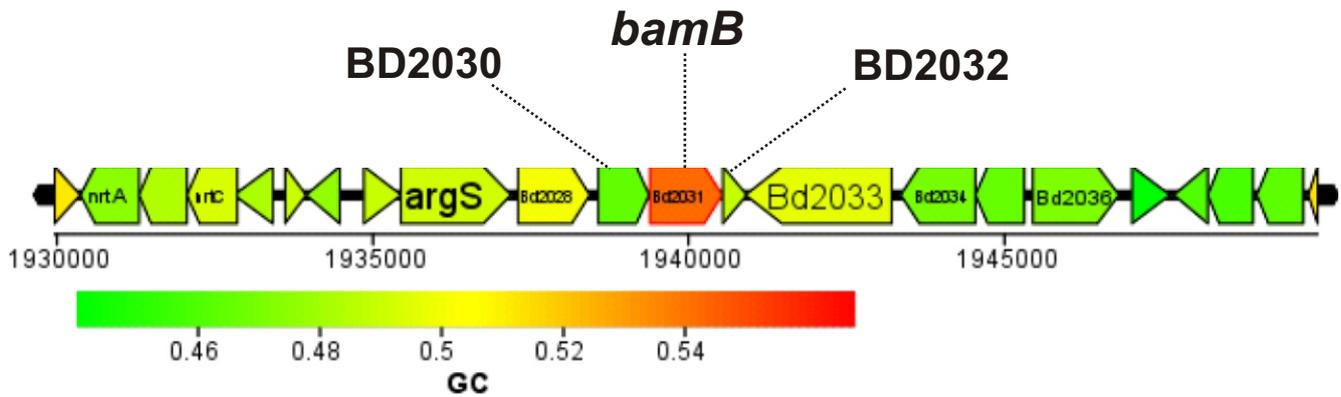

Figure S2: Gene context of the predicted *bamB* gene in the genome of *Bdellovibrio bacteriovorus* HD100. The GC content of the genome of str. Hd100 was mapped across the chromosomal locus encompassing the gene BD2031 (*bamB*) using XBASE (Chaudhuri, R.R., Loman, N.J., Snyder, L.A., Bailey, C.M., Stekel, D.J., Pallen M.J. (2008) *Nucleic Acids Res.* 36(Database issue):D543-546). The upstream gene BD2030 encodes a protein of unknown function conserved only in other δ -proteobacteria. Together with characterized genes such as *argS*, it defines this chromosomal locus. The down-stream sequence BD2032 is not conserved in other δ -proteobacteria, but is highly similar (40-50% sequence identity) to sequences in the genomes of various bacteria (closest relatives *Neisseria weaverii* and *Kingella oralis*), and the Conserved Domain Architecture Tool suggests sequence similarity with L-413C-like integrases. Evidence that the BD2031(*bamB*) gene is functional in *B. bacteriovorus* comes from an observed 6-fold induction of gene expression on the switch from (non replicating) predatory hunter form to axenic grower on peptone rich media (Lambert, C., Chang, C.Y., Capeness, M.J., Sockett, R.E. (2010) *PLoS One* 5:e8599).

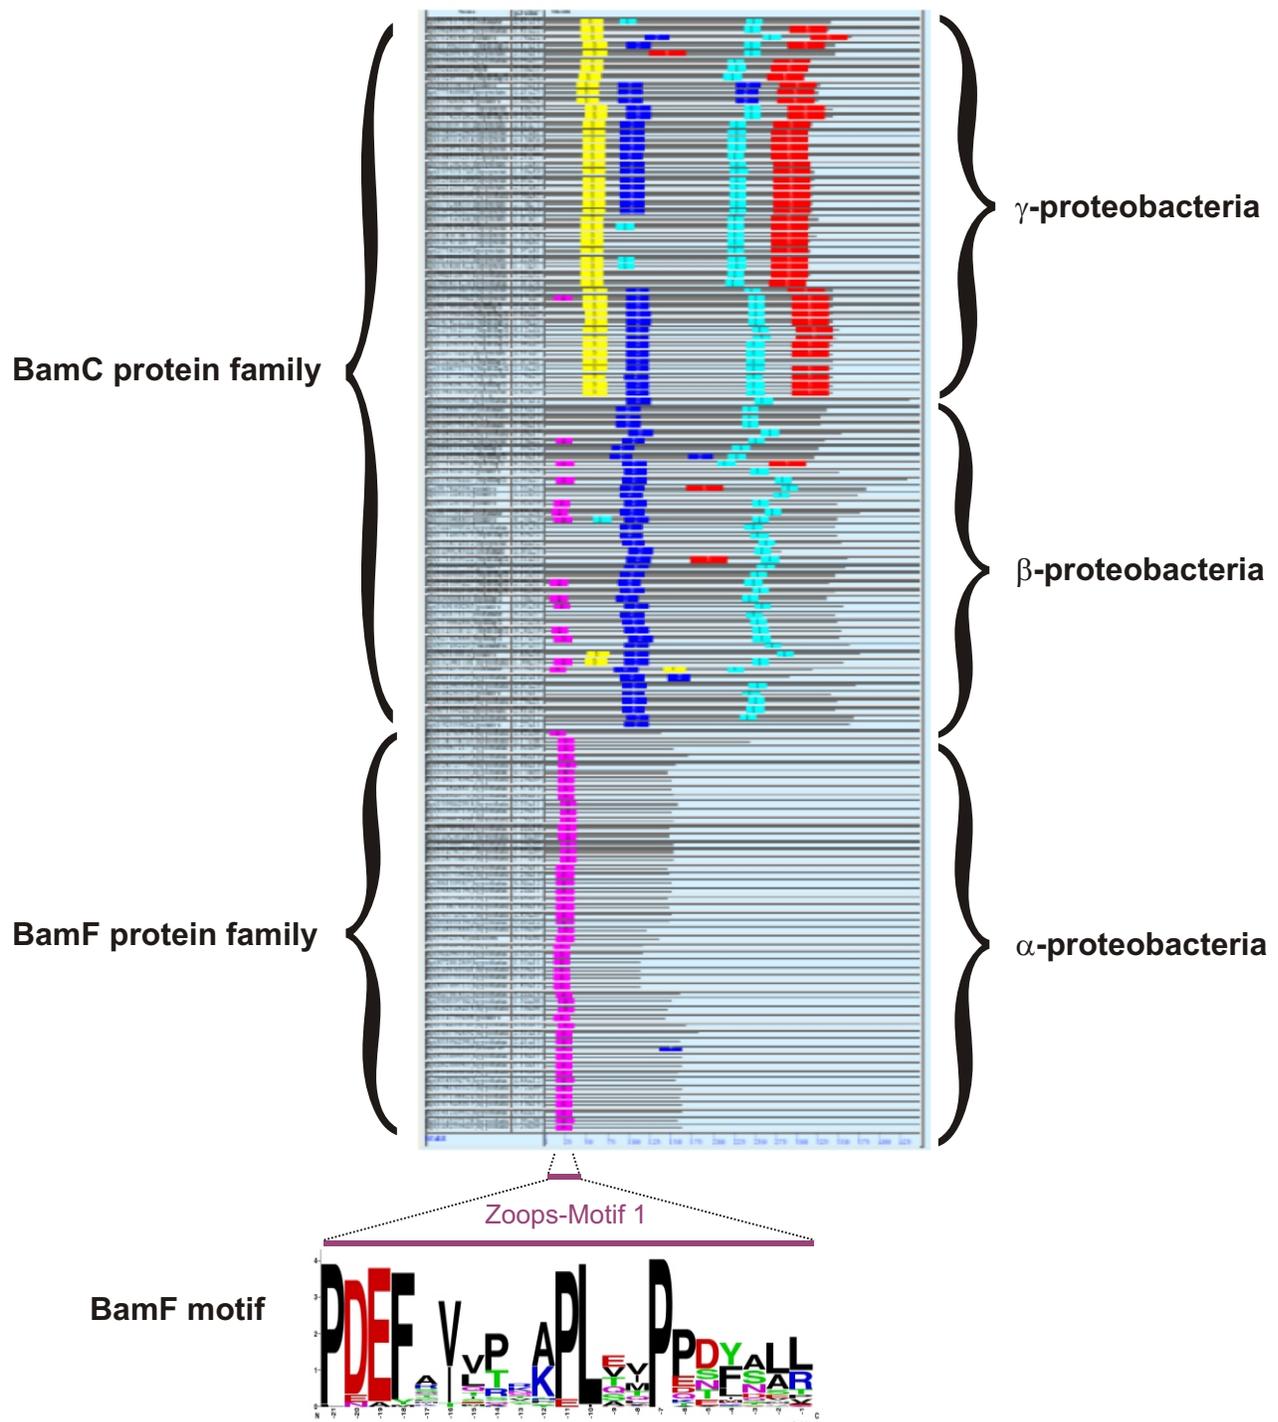

Figure S3. Motif analysis of the BamC-family of proteins and the BamF-family of proteins. Each of the protein sequences analysed is represented as a single line, and these have been sorted into species of γ -proteobacteria, β -proteobacteria and α -proteobacteria. The common motifs are shown as colored boxes on each protein sequence: “Zoops motif 1” (colored in pink) corresponds to the sequence logo shown as the BamF motif. It is found in all α -proteobacterial BamF proteins and also in many β -proteobacterial BamC proteins. Although the motif is not strictly conserved in γ -proteobacteria, the corresponding region in all BamC sequences shows some sequence similarity (documented in Figure 4). There are three strongly-conserved motifs within the structured domains of γ -proteobacterial and β -proteobacterial BamC sequences (the motifs are shown in blue, cyan and red) that define elements of the 'helix-grip' fold. In addition, a short conserved motif ($E=2.5 \times 10^{-156}$; colored in yellow) was found in the N-terminal 'unstructured' region: it sits between the helix-grip domains and the region of sequence conserved across the BamF- and BamC-protein families. In the *E. coli* BamC sequence, this “motif 2” appears

CDPro Algorithm	α - helix	β - sheet	turns	unordered
