Fig 1

HABs showed an anhedonic behavior in the sucrose preference test

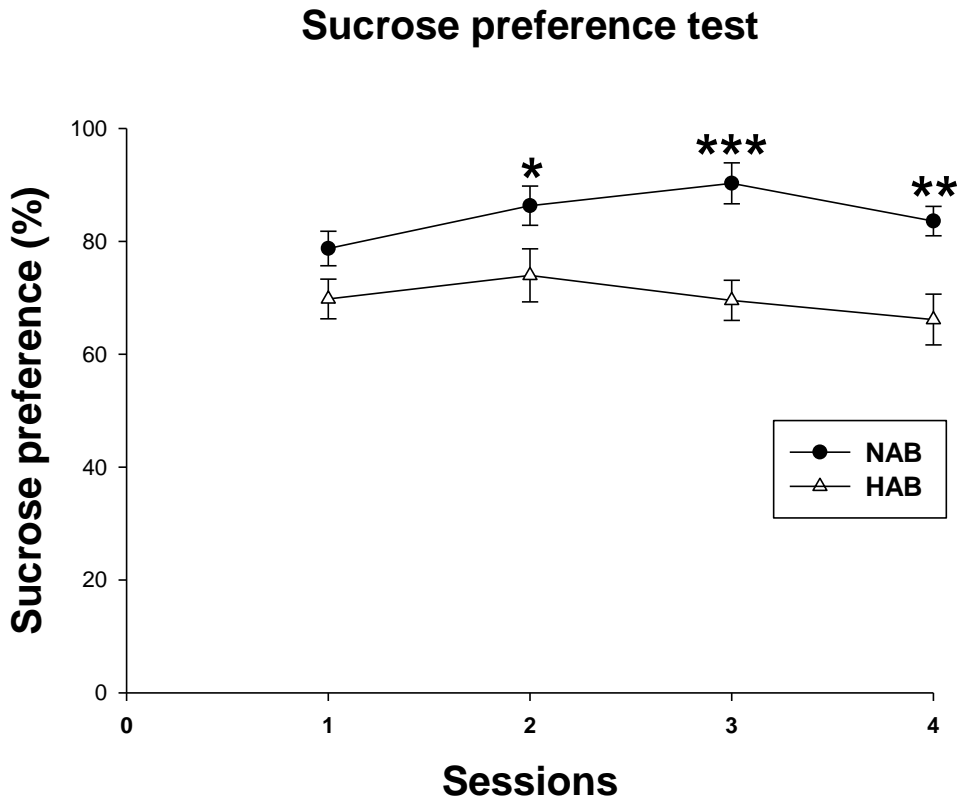

Fig 1. **Differential changes in sucrose test parameters in HABs and NABs.** Repeated measures ANOVA revealed a significant group effect ($p < 0.001$). Duncan's post hoc test revealed that HABs showed a lower preference for sucrose in comparison to NABs in 3 out of 4 sessions. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$. $n = 9-12$ mice/ group. Data are represented as mean \pm s.e.m.
