

Supplementary Figures

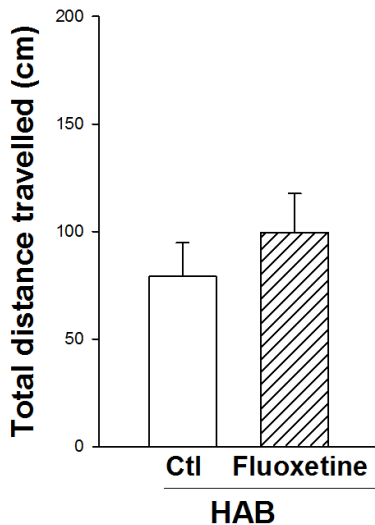

Fig 2

Chronic fluoxetine treatment had no effect on the anxiety-related behavior in HABs

(a) Experimental paradigm

(b) Open field test

(c) Light dark test

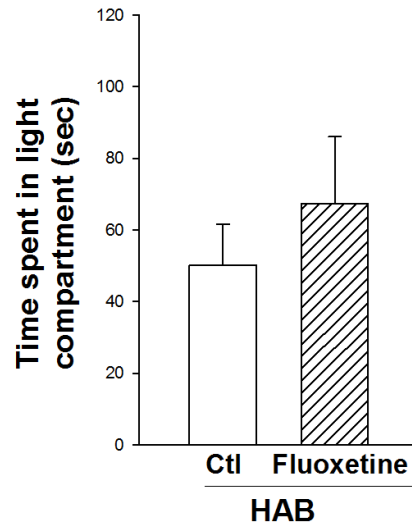

Fig 2. **Effect of chronic fluoxetine on the locomotor activity and anxiety-related behavior in HABs.** (a) Experimental paradigm (b) One way ANOVA revealed that there was no difference in the total distance travelled Ctl and fluoxetine treated HABs ($p > 0.05$) in the open field test. (c) In addition, there was no significant difference between Ctl and fluoxetine treated HABs ($p > 0.05$) in the time spent in the light compartment. Ctl: control, $n = 9$ mice/ group. Data are represented as mean \pm s.e.m.
