a. CPU time was based on a workstation with dual Intel Quad-Core 2.83 GHz processors.

b. Only one out of five runs was stopped with relative improvement of the objective function below 1% between iterations. The rest did not converge within the 5-day time limit after iterating for 583, 989, 777, and 661 times. The corresponding Φ_C at termination were 4.85×10^{-2} , 1.39×10^{-2} , 1.75×10^{-2} and 3.75×10^{-2} , respectively.

c. Mean value and standard deviation (\pm) out of five runs.

d. Root mean square error of model predictions, where the underlined value refers to the objective function of the minimization.
