Online methods:

Ex vivo isolation of colon LECs and BECs by high-speed cell sorting

Eight-weeks-old C57BL/6J mice, maintained under conventional conditions, were used to obtain colon tissue for the *ex vivo* cell isolation of endothelial cells as previously described ¹. Briefly, the washed colon was cut into pieces and incubated in 8 mg/ml collagenase IV (Invitrogen, Carlsbad, CA), 0.5 mg/ml DnaseI (Roche, Rotkreuz, Switzerland), and 5 mM CaCl₂ in PBS at 37°C for 15 min. After passing through a cell strainer (BD Biosciences, Franklin Lakes, NJ), cell suspensions were centrifuged, resuspended and immunostained with allophycocyanin (APC)-conjugated rat anti-mouse CD31 antibody, fluorescein isothiocyanate (FITC)-conjugated rat anti-mouse CD45.2 antibody (BD Biosciences), or hamster anti-mouse podoplanin antibody (clone 8.1.1; Developmental Studies Hybridoma Bank, University of Iowa, Iowa City, IA) followed by anti-hamster phycoerythrin (PE)-conjugated secondary antibody (Invitrogen) or isotype control antibodies (BD Biosciences). FACS was performed using a FACSAria and the FACSDiva software (BD Biosciences). Data were analyzed with FlowJo software (Treestar, Ashland, TN). Animal experiments were approved by the Kantonales Veterinaeramt Zurich.

RNA extraction and amplification

Colon LECs and BECs were sorted directly into 200 µl of 4 °C RLT Plus lysis buffer (Qiagen, Basel, Switzerland) supplemented with β-mercaptoethanol for immediate cell lysis and RNA preservation. RNA was extracted from lysed cells with the RNeasy Plus Micro kit (Qiagen). Amplification of RNA was performed with the Whole Transcriptome-Ovation Pico RNA Amplification System (NuGEN Technologies, San

Carlos, CA). The primers had a DNA portion that hybridizes either to the 5' portion of the poly (A) sequence or randomly across the transcript. SPIA amplification, a linear isothermal DNA amplification process, was used to prepare single-stranded cDNA in the antisense direction of the mRNA starting material. The quantity and quality of amplified cDNA was determined with a NanoDrop ND 1000 (NanoDrop Technologies, Delaware, USA) and a Bioanalyzer 2100 (Agilent).

Microarray hybridization

Amplified RNA samples with good Bioanalyzer profile (peak length around 500 nt) were chosen for the microarray experiments. Single-stranded cDNA (4 µg) obtained from 4 matched pairs of LECs and BECs was fragmented and biotin-labeled using the FL-Ovation cDNA Biotin Module V2 kit (NuGEN Technologies). Biotin-labeled cDNA targets were mixed in 220 µl of Hybridization Mix (Affymetrix Inc., Santa Clara, CA) containing hybridization controls and control oligonucleotide B2 (Affymetrix Inc.). Samples were hybridized to GeneChip Mouse Genome 430 2.0 arrays for 18h at 45°C at the Functional Genomics Center Zurich. Arrays were washed using an Affymetrix Fluidics Station 450 FS450 0004 protocol. An Affymetrix GeneChip Scanner 3000 was used to measure the fluorescence intensity emitted by the labeled target.

Data processing, quality control and analyses

Quality control and summarization based on the MAS5.0 algorithm^{2,3} were performed in R using the *simpleaffy* package of BioConductor^{4,5}. Cell Intensity files (.CEL) were processed into expression values for all of the 45,101 probe sets (transcripts) on each array (n=8). Probe sets with a majority of absent detection calls in all groups were filtered out. Lists of differentially expressed probe sets were produced with pairwise comparisons with pairs defined as LECs and BECs from the same animal. Differentially expressed genes were selected if they passed t-test criteria ($p \leq 0.01$) and showed at least 2-fold changes between the two groups. The Affymetrix probe sets were translated to gene symbols using both the *biomaRt* library and annotation files provided by Affymetrix^{6,7}. All experiments were designed and all information was compiled in compliance with MIAME guidelines⁸. The array data have been deposited in the National Center for Biotechnology Information (NCBI) Gene Expression Omnibus (GEO) and are accessible through GEO Series accession no. GSE22034.

Quantitative real-time PCR

Ten ng of cDNA per reaction obtained by amplifying the RNA from sorted cells was used per reaction of the real-time PCR experiments. Taqman Gene Expression Master Mix and assays (Applied Biosystems, Foster City, CA) were used to determine the expression levels of VEGFR1 (Mm_01210866_m1), podoplanin (Mm00494716_m1), LYVE-1 (Mm01280692_m1), Nrp-1 (Mm01253206_m1) and Nrp-2 (Mm00803099_m1). Duplex reactions with beta-actin (4352341E) as endogenous control were run under standard conditions (AmpliTaq Gold enzyme activation 95°C for 10 min, 40 cycles of denaturation at 95°C for 15 sec and annealing and extension at 60°C for 1 min). Power SYBR Green PCR Master Mix (Applied Biosystems) and QuantiTect Primer Assays (Qiagen) were used to determine the expression levels of Sema3A (QT00173971), Sema3D (QT00125874) and Sema3G (QT1160887) with beta-actin as endogenous control (QT01136772). RNA was also extracted from human LECs and BECs, isolated and cultured as previously described⁹, and from HUVEC cells (ScienCell, Carlsbad, USA) with the RNeasy Micro kit (Qiagen) including the on-column DNase treatment, and transcribed to cDNA using the High Capacity cDNA Reverse Transcription Kit (Applied Biosystems). QuantiTect Primer Assays (Qiagen) for human Sema3A (QT00040936), Sema3D (QT00037023) and beta-actin primers (forward: 5'-TCACCGAGCGCGGCT-3', reverse: 5'-TAATGTCACGCACGATTCCC-3') were used with Power SYBR Green PCR Master Mix (Applied Biosystems), and PCR reactions were performed under standard conditions. A 7900HT Fast Real-Time PCR System (Applied Biosystems) was used for all qPCR experiments.

Immunohistochemistry

Serial sections of paraffin-embedded mouse colon were incubated at 60°C for 4h, deparaffinized and boiled in citric buffer for antigen retrieval. After endogenous peroxidase block, sections were incubated in 1% Triton X-100 (Sigma Aldrich, Munich, Germany) and blocked with 1% BSA and 0.5% donkey serum in PBS. Immunostaining was performed with goat anti-Sema3A antibody (C-17, Santa Cruz, Santa Cruz, CA), rabbit anti-LYVE-1 antibody (kind gift from N. Gale, Regeneron Pharmaceuticals, Tarrytown NY) or goat IgG, followed by biotin-labeled secondary antibodies (Vector, Burlingame, CA). Streptavidin-conjugated peroxidase was used

with the AEC kit as a substrate (Vector). Hematoxylin was used for nuclear counterstains.

***In utero* treatment of mice**

Timed pregnancies were set up in FVB/N wild type mice. The morning when vaginal plugs were found was defined as day E0.5. On days E12.5, E14.4 and E16.5 the pregnant females (3 per group) received intraperitoneal injections of 1.2 mg of anti-Nrp-1A antibody, anti-Nrp-1B antibody^{10, 11} or the control mouse IgG antibody (Sigma). Neonatal pups were collected for analysis at day P5.5.

Whole-mount staining

Intestines with attached mesentery were collected from embryos or neonatal mice and fixed in 4% PFA. Intestines were pinned onto the silicon-coated 6-well-plates to expose the mesentery and were washed several times with PBS. Tissues were then incubated in immunomix solution (0.2% BSA, 5% donkey serum, 0.1% Triton X-100 and 0.05% sodium-azide in PBS) for 1h at room temperature. Primary antibodies were diluted in immunomix solution and were applied over night at room temperature, followed by washing with 0.1% Triton-X for 4h. Secondary antibodies were diluted in a 1:1 mixture of PBS and immunomix solution. Tissues were incubated at room temperature for 4h and washed with 0.1% Triton-X for 4h, followed by short postfixation with 4% PFA and several PBS washes. Thereafter, tissues were mounted in Vectashield (Vector) onto chambered coverglasses (Nunc, Rochester NY) for confocal imaging. Antibodies used were mouse Cy3-conjugated anti-SMA (Sigma), goat anti-VEGFR3 (AF743, R&D Systems Abingdon, United Kingdom), rabbit anti-Prox1 (kind gift from Dr. K. Alitalo), mouse anti-Nrp-1A¹⁰; goat anti-Nrp-1 (R&D Systems), hamster anti-CD31 (2H8 clone, Millipore, Billerica, MA, USA), goat anti-integrin-alpha 9 (R&D Systems), mouse anti-FNIIIIEA (clone FN-3E2, Sigma), rat anti-mouse CD31 (clone MEC 13.3, BD Biosciences), and AlexaFluor 488, 555, 594 or 647-conjugated secondary antibodies (Invitrogen). For some stainings ProLong® Gold antifade reagent with DAPI (Invitrogen) was used. For quantification of lymphatic valves, total number of valves identified by staining for intergrin-alpha9 and FNEIIIA was counted on five mesenteric vessels in 2-3 mice subjected to each type of treatment. Whole-mount images were acquired with a LSM 710 FCS confocal

microscope and ZEN software (Zeiss, Jena, Germany) and processed with IMARIS software (Bitplane AG, Zürich, Switzerland).

Pericyte culture and migration

Primary human pericytes (PromoCell, Heidelberg, Germany) were cultured according to the manufacturer's recommendations. Total RNA was isolated from pericytes and HUVECs (ScienCell), and real-time PCR was performed with TaqMan gene expression assays for Nrp-1 (Hs00826128_m1) and CD31 (Hs00169777_m1), using the Taqman Gene Expression Master Mix (Applied Biosystems). Pericytes seeded onto chambered coverglass (Nunc) were fixed in 4% PFA and permeabilized with 0.3% Triton-X. Thereafter, cells were blocked with goat serum and primary goat antibody to Nrp-1 (clone C-19, Santa Cruz) or control goat IgG (Abcam, Cambridge, UK) were applied, followed by an AlexaFluor 594 conjugated secondary antibody (Invitrogen) and Hoechst bisbenzimide (Invitrogen). Images were acquired with a LSM 710 FCS confocal microscope and ZEN software (Zeiss). Transwell migration assays were performed using polycarbonate, 8 µm pore size-membrane 24-well plates (Corning Life sciences). 40,000 pericytes at passage 6-7 were seeded in serum-free medium onto the upper side of the insert that was coated with 1 µg/ml fibronectin (Millipore) on the bottom side and blocked with 0.2% BSA. Cells were allowed to migrate for 3h to the lower chamber containing either 1% FCS alone or also recombinant Sema3A (50, 100 or 200 ng/ml; R&D Systems) and Nrp-1A, Nrp-1B or control mouse IgG antibodies (20 µg/ml). Non-migrated cells were mechanically removed, migrated cells were stained with Hoechst bisbenzimide and 5 random images were taken per insert. Nuclei from 3 wells per condition were counted using the ImageJ program (National Institutes of Health, Bethesda), and the unpaired t-test was used to calculate the p-values.

Lymphatic vessel tracing

Approximately 3 µl of 5 mg/ml FITC-dextran (Mw ~2000 kDa; Invitrogen) was injected into the forelimb footpad of anaesthetized P5.5 mice (n=8 per group). After 2 min, forelimb lymphatic vessels were imaged noninvasively using a stereomicroscope Lumar.V12 and AxioCam digital camera (Zeiss). After 15 min, the pups were sacrificed, the overlaying skin was removed and the lymphatic vessels were imaged.

Immunofluorescence analysis

Abdominal skin and small intestine were dissected from treated and control pups (n=3-5 per group) at day P5.5 and snap frozen in optimal cutting temperature compound (Sakura Finetek, Zoeterwoude, NE). Eight- μ m cryosections were immunostained with rat anti-mouse CD31 antibody (BD Biosciences) and rabbit LYVE-1 antibody (Angiobio, Del Mar, CA) as described ¹. The tissue area occupied by vessels was quantified using IP LAB software (Scanalytics, Fairfax, VA).

Analysis of retinal neovascularization

Eyes from P5.5 pups (n=7-9 per group) were enucleated and retinas were dissected from the eyecup. After blocking and permeabilization in 0.5% BSA and 0.3% Triton X-100-containing PBS, staining with biotinylated isolectin B4 (Vector) diluted in PBLEC (0.1% Triton X-100, 0.1 mM CaCl₂, 0.1 mM MgCl₂, 0.1 mM MnCl₂, in PBS [pH 6.8]) was performed overnight at 4°C. Retinas were then washed and Alexa 488-streptavidin (Invitrogen) was added. Stained retinas were flat-mounted in Vectashield for imaging with an Axioskop2 motplus microscope and an AxioCam MRc digital camera (Zeiss). Vascular extension was calculated by measuring the distance from the optic nerve head to the vascular edge and the distance from the optic nerve head to the edge of retinal cup. Quantification of vascular density was performed by determining the area covered by vessels in the region of vascular remodeling ¹¹. The analyses were performed using Adobe PhotoShop CS4 Extended software.

Online Figure I. *In utero* blockade of Sema3A/Nrp-1 signaling leads to decreased body weight of mice at P5.5. Treatment of mice *in utero* (E12.5-E16.5) with an antibody that blocks Sema3A binding to Nrp-1 (anti-Nrp-1A), but not with an antibody that blocks VEGFA binding to Nrp-1 (anti-Nrp1B), resulted in reduced body weight of mice at day P5.5 when compared to control mice (lines indicate the mean value, **p<0.01, n=9-13).

Online Figure II. Additional examples of defective lymphatic vessel morphology and aberrant SMC coverage in anti-Nrp-1A treated mice. **(A)** Whole-mount preparations of mesenteries immunostained for CD31 (magenta), VEGFR3 (green) and Prox1 (red) were analyzed. When compared with control IgG-treated animals (first row), anti-Nrp-1A-treated animals (rows 2-4 representing 3 separate animals) showed defective collecting lymphatic vessels morphology in the mesentery (rows 2-4, arrowheads). CD31 staining differentiates lymphatic vessels (LV), veins (V) and arteries (A). Scale bars: 100 μ m. **(B)** Alpha-smooth muscle actin (α -SMA) expressing SMCs densely cover the vein (V) and artery (A), but not the Prox1 (red)-positive lymphatic vessels (asterisks) in control mice. Treatment of mice with anti-Nrp-1A antibody resulted in excessive coverage of collecting lymphatic vessels by SMCs (arrowheads), as shown by differential α -SMA (green) and Prox1 (red)

immunostaining of whole-mount prepared mesenteries at day P5.5. Scale bars: 50 μ m.

All images were obtained by confocal microscopy.

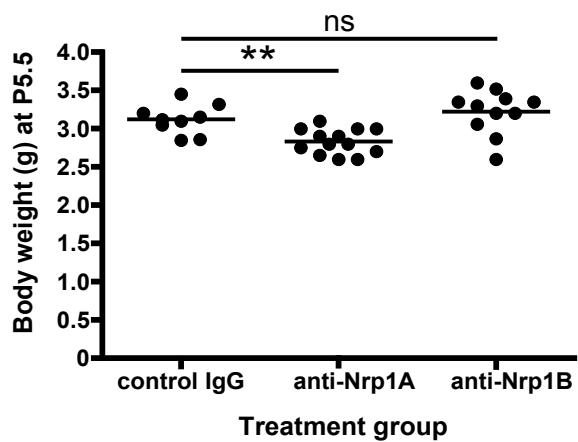

Online Figure III. (A) Fewer blood vessels are observed upon treatment with an antibody blocking VEGFA binding to Nrp-1 (anti-Nrp-1B). Representative images of abdominal skin cryosections of P5 mice stained for CD31 (red) and LYVE-1 (green). Scale bars: 100 μ m. **(B)** Quantification of the area occupied by blood vessels (CD31-positive, LYVE-1-negative), expressed as the percentage of the area occupied by vessels in the whole skin area (* $p=0.047$, n=3-5). Bars represent mean value \pm standard deviation. **(C) Blockade of Sema3A binding to Nrp-1 does not affect vascular remodeling in the developing retina.** Representative images of P5.5 retina vasculature stained for isolectin B4. Scale bars: 500 um. **(D)** Quantification of the vascular extension into the retina measured by dividing the distance from the optic nerve head to the edge of the vasculature with the distance from the optic nerve head to the retinal cup edge. **(E)** Vascular density quantification by measuring the area covered by vessels in the region of vascular remodeling. N (control IgG)=7, n (anti-Nrp-1A)=9. Bars represent mean value \pm standard deviation. Changes are not significant.

Online Table II. Gene microarray analysis of ex vivo isolated mouse intestinal blood vascular endothelial cells vs. lymphatic endothelial cells revealed genes that are specifically expressed by blood vessel endothelium. Complete list of significantly differentially expressed genes (\log_2 ratio ≥ 2 , p-value ≤ 0.01 , \log_2 signal ≥ 5 in BEC group).
