

Journal of Experimental Botany

Increased levels of IAA are required for system 2 ethylene synthesis causing fruit softening in peach (*Prunus persica* (L). Batsch)

Miho Tatsuki, Naoko Nakajima, Hiroshi Fujii, Takehiko Shimada, Michiharu Nakano, Ken-ichiro Hayashi, Hiroko Hayama, Hirohito Yoshioka, Yuri Nakamura.

Table S1 Oligonucleotide primers used in qRT-PCR

Name	Oligonucleotide sequence
PpACS1 forward	5'- GCCTTCCGGGTTTCGA-3'
PpACS1 reverse	5'- GGCGGCCACAACCATGT-3'
PpACS2 forward	5'-GGAAAAGCACTTCCAAGAAAATTG-3'
PpACS2 reverse	5'-CGCTCCTTGATCCCTTG-3'
PpACO1 forward	5'- GAATGTCGATAGCCTCGTTACA-3'
PpACO1 reverse	5'- GGTGCTGGGCTGATGAATG-3'
PpPG2 forward	5'- AAGGTTCGTGTGCCGTTGTA-3'
PpPG2 reverse	5'- CGGGATAATGTGAACGAGCAT-3'
<i>Prunus_v4_Contig5085</i> forward	5'- TGCGAAACCAGAACATCTCAAGA-3'
<i>Prunus_v4_Contig5085</i> reverse	5'- CCTCAGTTGACGCTGGATAAAA-3'
actin forward	5'- GATTCCGGTGCCCAGAAGT -3'
actin reverse	5'- CCAGCAGCTCCATTCCAA -3'

Table S2. Pearson's correlation coefficient (PCC) and signal intensity of 29 filtered genes with similar expression patterns for *PpACS1*

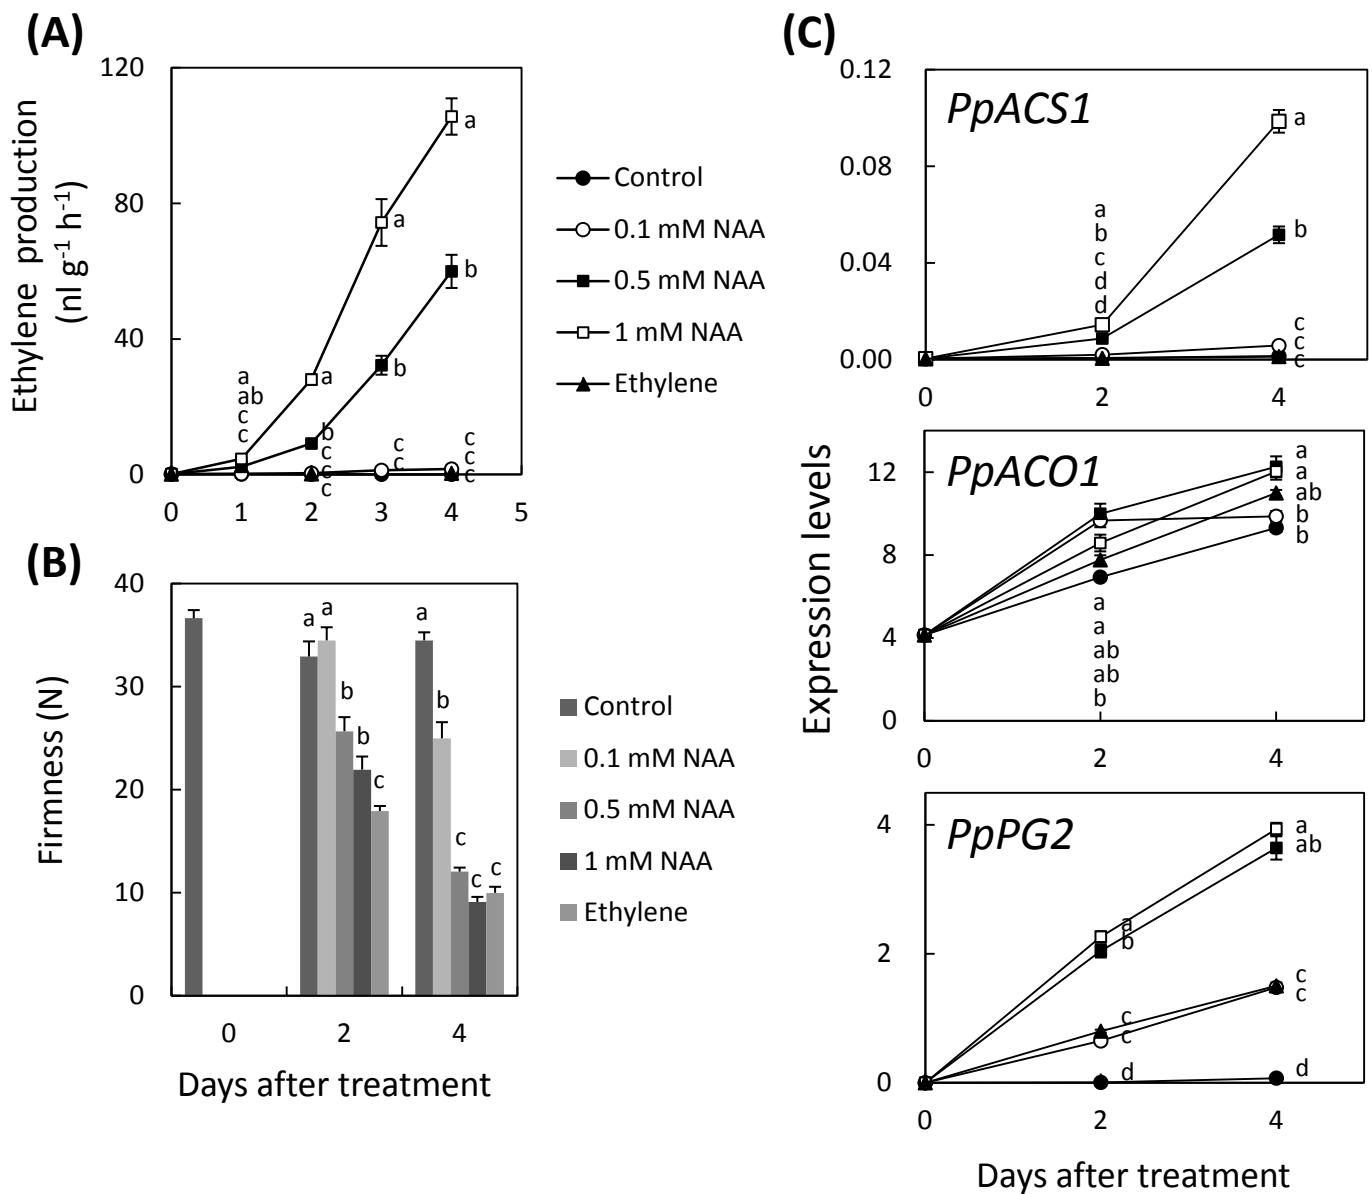

Figure S1

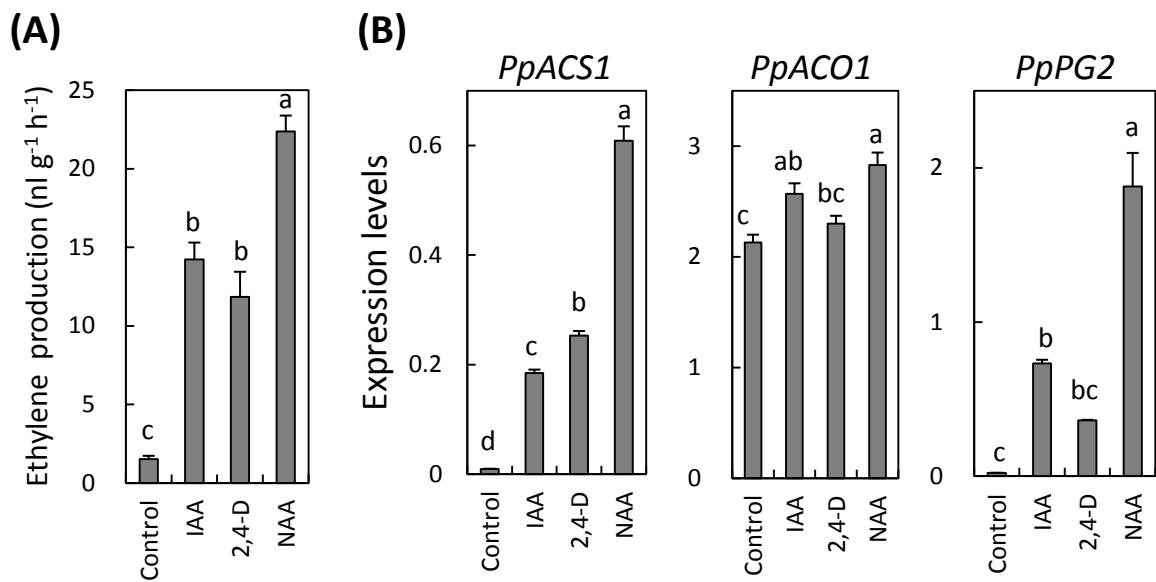

Figure S2

Figure Legends (Supplementary data)

Fig. S1 Effects of NAA on ‘Odoroki’ fruit ripening and gene expression. (A) Ethylene production, (B) flesh firmness of NAA-treated ‘Akatsuki’ fruit. Harvested mature fruit of ‘Manami’ were treated with 0.1 mM, 0.5 mM and 1 mM NAA each day or continuous 20 μ l L⁻¹ ethylene. Vertical bars represent the SE ($n = 10$). (C) Relative transcript abundance of *PpACS1*, *PpACO1*, and *PpPG2*. The steady-state levels were normalized to *actin*. Data are mean values \pm SD of three individual experiments, each performed in triplicate. Different letters indicated significant differences within the same day at $p < 0.05$ using Tukey’s *post hoc* test.

Fig. S2 Effect of some auxins on ethylene production and expression patterns of ripening-related genes of ‘Manami’. (A) Ethylene production, and (B) relative transcript abundance of *PpACS1*, *PpACO1*, and *PpPG2* in mesocarp disks of ‘Manami’ treated with 0.5 mM IAA, 0.5 mM 2,4-D, or 0.5 mM NAA. Tissue cylinders (9 mm in diameter) were excised from ‘Manami’ mesocarp with a cork borer, 5 mm thick discs were cut with a razor blade from the cylinders, and 42 discs were used for each treatment. The prepared discs were placed on paper filters soaked with auxin or anti-auxin solution and stored at 28 °C for 18 h. Vertical bars of ethylene production represent the SE ($n = 10$). (B) The steady-state levels were normalized to *actin*. Data are mean values \pm SD of three individual experiments, each performed in triplicate. Different letters indicated significant differences at $p < 0.05$ using Tukey’s *post hoc* test.
