

- **Mix with cellular extract**
- **Pulldown by avidin beads**
- **Separation in SDS PAGE**
- **Silver staining**

Supplementary information, Figure S5 A procedure for preparation of biotin-labeled RoR probes.

DNA fragments E3 or E4-d2 were PCR amplified and cloned into pCR8 vector and then linearized with restriction enzyme Not I, and in vitro transcribed using T7 polymerase in the presence of biotin-UTP. Total cellular extract was used for RNA precipitation.
