

Supplementary information, Figure S8 (A) RoR is predominantly in the cytoplasm (MCF-7 cells) as detected by in situ hybridization.

(B) p-hnRNP I is in the cytoplasm whereas hnRNP I is in the nucleus. MCF-7 cells were stained with antibody against hnRNP I or p-hnRNP I, followed by secondary antibody labeled with Alexa Flour 488 or 568.

(C) Detection of Myc-tagged hnRNP I WT or mutant (S16A) in the cells after transfection by Myc tag antibody.
