

**Figure S3: HA does not induce fibrotic gene expression of MNCs compared to other coating conditions.** Fibrosis-associated gene expression in bone marrow mononuclear cells cultured on different coating materials were analyzed by real-time RT-PCR after 1 and 3 days. Data are presented as mean  $\pm$  SEM. \*  $P < 0.05$ , \*\*  $P < 0.01$ , \*\*\*  $P < 0.001$ .  $n = 4$  per group.
