Note: We used rice expression profile data in RICE GE data base to identify the endosperm specific genes by using the below mentioned criteria.

1. Endosperm has the highest expression among the 13 tissues we downloaded from riceGE (<http://signal.salk.edu/cgi-bin/RiceGE>) and the signal intensity is >500. This is to confirm genes are expressed in endosperm.
2. All the other tissues have intensity < 500. This is to confirm genes are not expressed in other tissues.
3. Endosperm signal intensity is 10 times higher than other tissues.
