

Supplementary Figure 1:

Confluent HUVEC monolayers were pre-treated with 50 μ M of IRW or IQW for 4h or 8h prior to 4h stimulation with 5ng/mL TNF. ICAM-1 (A) and VCAM-1 (B) were quantified by densitometry and normalized to tubulin bands on western blotting of the cell lysates. Representative images from 4 independent experiments are shown. Data presented as mean \pm SEM.
