Electronic Supplementary Material

Increasing phosphoproteomic coverage through sequential digestion by complementary proteases

Jason M. Gilmore, Arminja N. Kettenbach, and Scott A. Gerber

Fig. S1 Distribution of detected phosphorylation sites across SCX fraction. Grey bars indicate the total count of unique phosphorylated residues detected by fraction. Red bars indicate the number of these which were not detected in the corresponding fraction of a trypsin based replicate analysis (TrypA). Results are shown for (a) Glu-C, (b) GSPT, (c) TrypB, (d) GPST, and (e) GPTS workflows

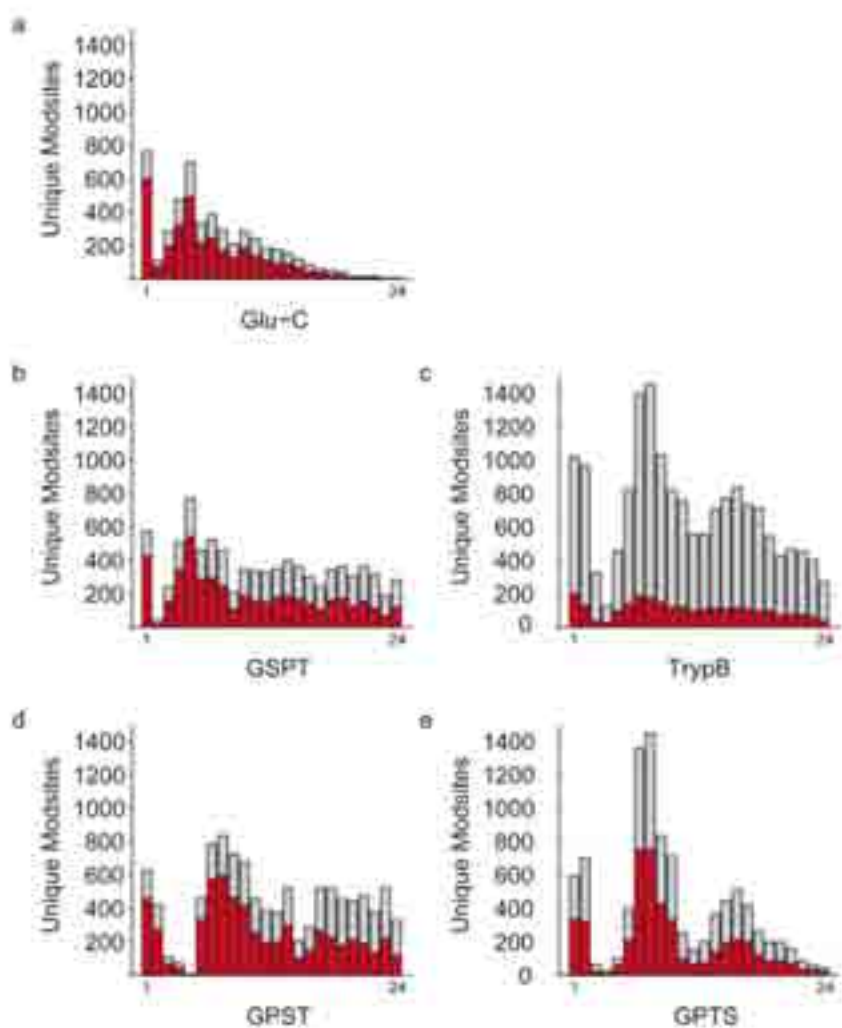

Table S1: Peptide identification information for Glu-C workflow. SCX fraction number, protein reference, peptide sequence, phosphorylation localization, charge state, and SEQUEST scoring metrics (cross correlation, delta correlation, and ppm) are provided. Reverse hits that pass filters are included and used to maintain <1% false positive rate.

Table S2: Peptide identification information for GSPT workflow. SCX fraction number, protein reference, peptide sequence, phosphorylation localization, charge state, and SEQUEST scoring metrics (cross correlation, delta correlation, and ppm) are provided. Reverse hits that pass filters are included and used to maintain <1% false positive rate.

Table S3: Peptide identification information for GPST workflow. SCX fraction number, protein reference, peptide sequence, phosphorylation localization, charge state, and SEQUEST scoring metrics (cross correlation, delta correlation, and ppm) are provided. Reverse hits that pass filters are included and used to maintain <1% false positive rate.
