

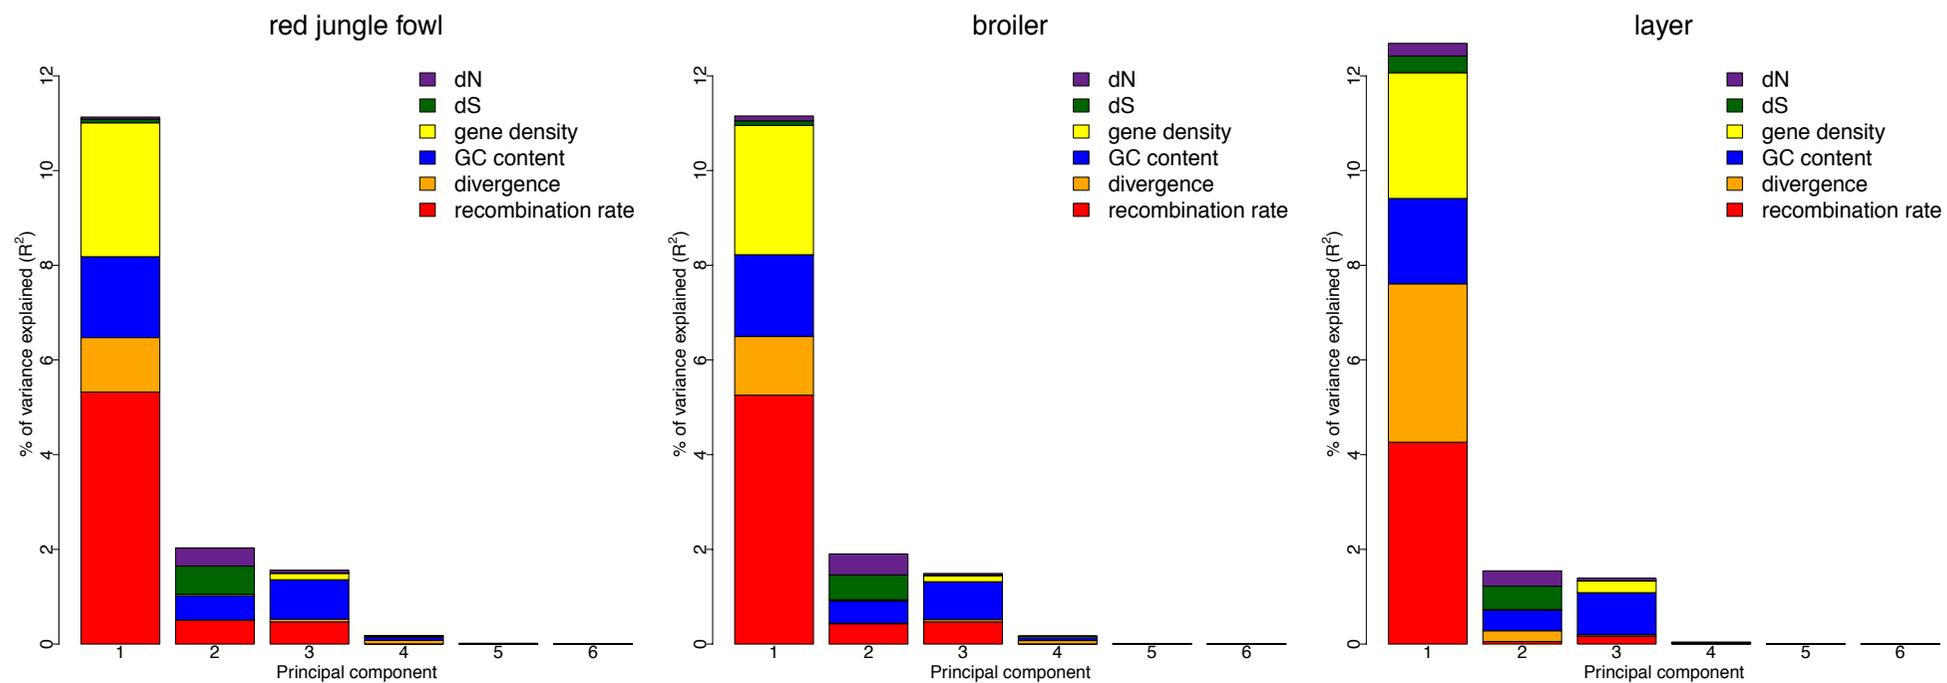

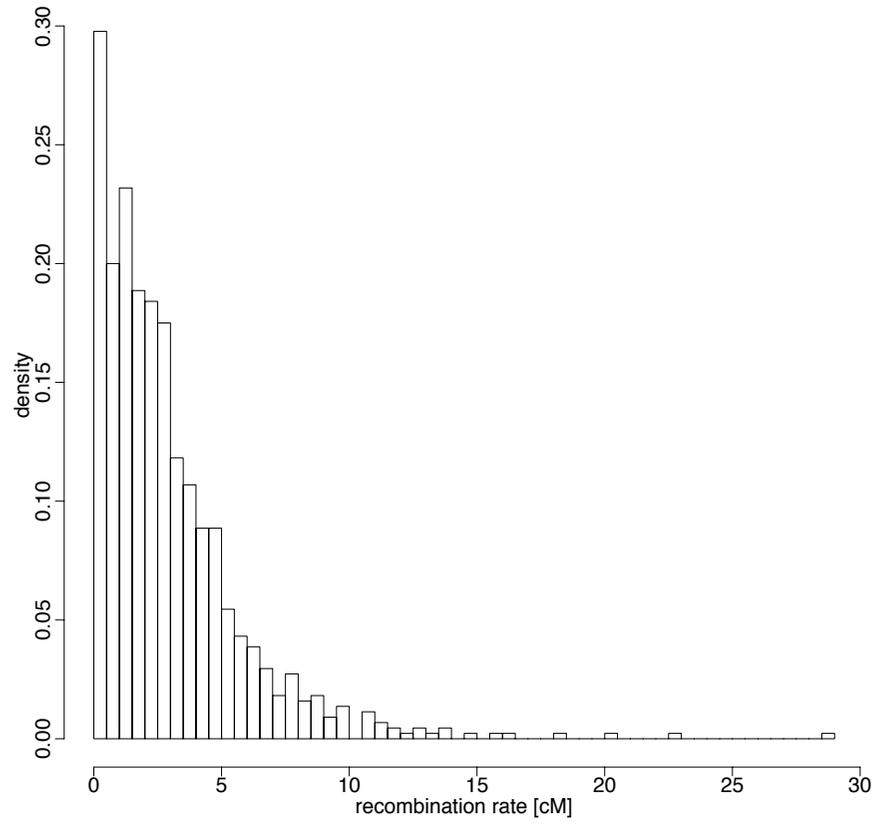

**Figure S1.** Biplots of the first two principal components (PCs) for diversity level across the genome for three window sizes, 1 Mb, 500 kb and 250 kb. In each graph one black dot represents one window, where observations of diversity level in the three populations are projected into the space of the first two PCs. The red arrows labeled RJF, Broiler and Layer display the loadings for diversity level in the respective population. Arrows which represent the loadings of the three populations on PC I and PC II showed a strong component along PC I all pointing in the same direction and a much weaker along PC II.

**Figure S2.** Amount of variation in local diversity level in each of the three chicken populations explained by the different explanatory variables based on PLSR analysis.

**Figure S3.** Histogram of recombination rate in cM per 1 Mb window.

Table S1: Summary of genome-wide averages and 95% bootstrap confidence intervals (CIs) of diversity level,  $p_S$ ,  $p_N$  and  $p_N/p_S$  estimates for the three different chicken populations. For diversity level data for three different window sizes are included whereas for  $p_S$ ,  $p_N$  and  $p_N/p_S$  only 1 Mb windows are considered due smaller sample sizes.

	window size	red jungle fowl		broiler		layer	
diversity $\times 10^4$	1 Mb	3.69	(3.62, 3.75)	3.42	(3.36, 3.48)	3.06	(3.00, 3.12)
	500 kb	3.98	(3.92, 4.03)	3.61	(3.56, 3.66)	3.27	(3.22, 3.32)
	250 kb	4.07	(4.02, 4.11)	3.70	(3.66, 3.74)	3.36	(3.31, 3.40)
$p_S \times 10^4$	1 Mb	5.12	(4.79, 5.49)	5.11	(4.90, 5.32)	4.66	(4.43, 4.89)
$p_N \times 10^5$	1 Mb	5.50	(4.90, 6.09)	5.38	(5.03, 5.81)	5.01	(4.61, 5.43)
$p_N/p_S$	1 Mb	0.107	(0.093, 0.122)	0.105	(0.098, 0.114)	0.108	(0.098, 0.119)

Table S2: Estimates and  $p$ -values in a multi-linear regression analysis for six possible explanatory variables of chicken diversity level in 500 kb windows for the three populations and for common genetic variation. Estimates and  $p$ -values significant at a threshold  $< 0.001$  are highlighted in bold.
