

Fig. S1. Distribution of leukocytes in airways of allergic mice after MM218 treatment.

BAL fluid was collected from individual OVA primed/challenged mice treated i.p. with MM218 or PBS on days 7, 9 and 11 of the regimen. Leukocytes were analyzed by flow cytometry to establish the relative distribution of neutrophils, CD8⁺ T cells, monocytes, eosinophils and CD4⁺ T cells for the two groups, compared to airway cells from naïve mice. Data show mean cell numbers for each group (n=6 per group) \pm SE with a Student's t-test analysis used to determine statistically significant differences between OVA+MM218 and OVA+PBS groups. *** = $P < 0.001$; * = $P < 0.05$.
