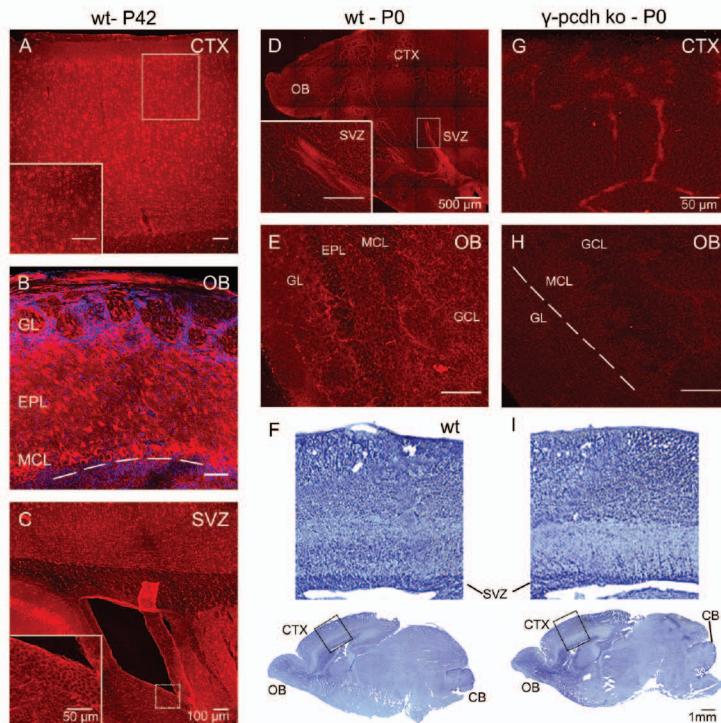

Figure S1. Expression of γ -pcdhs in the adult and postnatal mouse brain. (A-C) Abundant γ -pcdh expression is found throughout the adult mouse brain, in the cortex (A), in the OB (B) and in the SVZ (C), as shown for γ -pcdh immunolabeling on parasagittal sections of adult wt mice at P42. Insets showing magnification of cortex (A) and SVZ (C). (D, E) Ubiquitous γ -pcdh expression in the SVZ (D) and in the OB (E), shown on parasagittal sections of postnatal wt brain at P0. Inset in (D) showing magnification of SVZ. (G, H) No expression of γ -pcdhs is found in the postnatal γ -pcdh ko brain at P0. (F, I) Nissl staining on parasagittal sections revealed no gross defects in cortical layering in wt mice nor in their γ -pcdh ko siblings at P0. Abbreviations: CTX, cortex; EPL, external plexiform layer; GL, glomerular cell layer; GCL, granular cell layer; MCL, mitral cell layer; OB, olfactory bulb; SVZ, subventricular zone. Scale bars in A-C, 100 μ m, in insets 50 μ m, in D 500 μ m, in inset 50 μ m, in E, G, H 50 μ m, in F, I 1 mm.

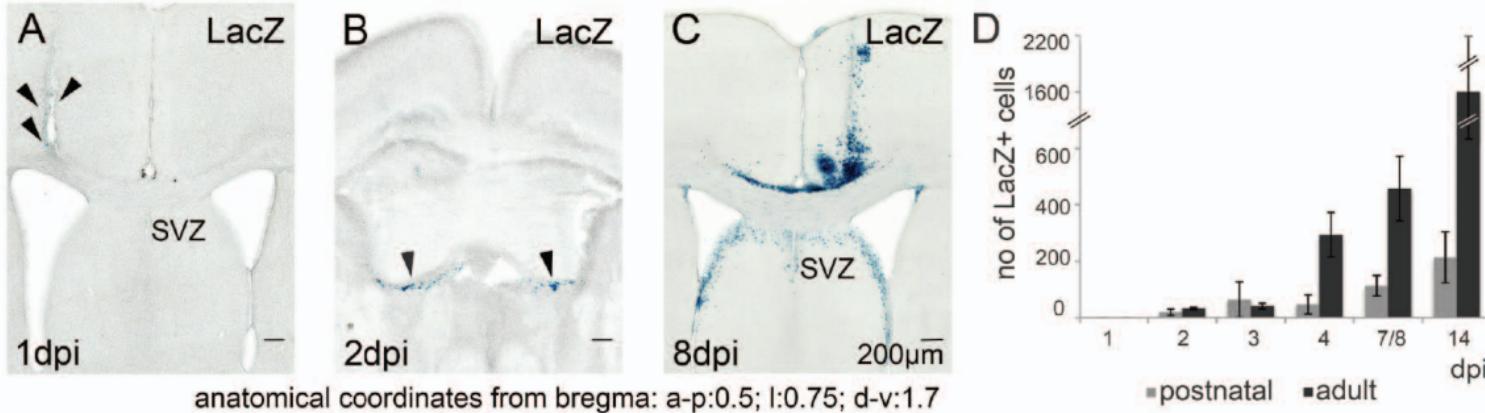

Figure S2. Onset of Cre recombinase activity. (A-C) Injection of LV-Cre-EGFP in the SVZ of Rosa26 reporter mice showing the onset of Cre recombinase activity by LacZ staining in the SVZ as early as 1 dpi (black arrows, A) with increasing signal intensity, here shown on a light microscopy image for 2 and 8 dpi on coronal sections (black arrows, B). Injection coordinates at the bottom of the images (a-p, anterior-posterior; l, lateral; d-v, dorso-ventral). (D) Quantification of cell numbers in postnatal and adult injected Rosa26 reporter mice at different stages after injection. Scale bars in A-C 200 μ m.
