

Supplemental Table 1

Induction of apoptosis by nelfinavir

RPMI8226 cells were incubated with nelfinavir at the concentrations indicated, and induction of apoptosis was quantified by measuring caspase 3/7 activity using the ApoOne assay (Promega) and fluorometric detection. The table indicates the relative increase in caspase 3/7 specific fluorescence relative to untreated control.

10	20	40	μ M nelfinavir
8.64	29.66	91.80	% increase in caspase 3/7 activity (relative to untreated control)
