

Supplementary Table 1. Effect of inhibition of SMS1 by D609 treatment on lipid levels. Reported are the levels of individual species of ceramide (**A**), DAG (**B**) and SM (**C**) as measured by mass spectrometry during treatment with D609 (50 µg/ml) after 24 and 48 hours. Since basal levels of lipids were variable among the different experiments whereas the pattern of changes between experimental conditions was similar (Figure 4A and B), reported are the absolute values of one representative experiment. In bold are the values that were significantly different compared to the time-matched control once the fold change versus the appropriate control was calculated among three independent experiments ($p<0.05$ versus CT). CT: Control cells.

Supplementary Table 3. Effect of overexpression of *BCR-ABL* in HL-60 cells on lipid levels. Reported are the levels of individual species of ceramide (**A**), DAG (**B**), and SM (**C**) extracted from HL-60/neo and HL-60/Bcr-abl cells as measured by mass spectrometry. Cells from each experimental condition were harvested after the same amount of time in culture and during the logarithmic stage of growth. Since basal levels of lipids were variable among the different experiments whereas the pattern of changes between experimental conditions were similar (Figure 5), reported are the absolute values of one representative experiment. In bold are the values that were significantly different compared to the time-matched control once the fold change versus the appropriate control was calculated among two independent experiments ($p<0.05$ versus HL-60/neo). BDL: below detection limit.
