----	-----	--	----------	-------	---------------------	----	----	-------	------

^aSpot IDs refer to the numbers in the supplemental figures.

^bAnnotation No. is that of Genbank genome annotation NC011761.

^cAnova test was performed for three replicates of each condition and spots with p-values < 0.05 were considered to be significant.

^dProteins with fold change ≥ 2.0 are regarded as differentially expressed.

^eMowse score is generated by Mascot and characterizes the hit of a peptide mass fingerprint (PMF) search giving the probability that the hit is a random match in the database (scores > 47 are significant with a significance threshold of 0.05).

^fSequence coverage (generated by Mascot) presents the percentage of the database hit that is covered by the submitted peptide masses of the experimentally acquired PMF.

^gMW is the predicted molecular weight of the database entry.

^hThe predicted isoelectric point (IP).

ⁱThe protein spot contains a mixture. No conclusions can be drawn regarding up-regulation of the individual protein. Mowse score and sequence coverage are given for the individual components.

^jUnique refers to spots present in either aerobic or anaerobic conditions that do not have a matching spot under the other condition (unique spots listed alongside up-regulated proteins under aerobic conditions do not have a match under anaerobic conditions and vice versa).

^kSpots identified by MS/MS and *de novo* protein sequencing.

Table S3. Microarray expression data of *Acidithiobacillus ferrooxidans*^T grown in aerobic and anaerobic conditions. Some of the reported gene transcripts were <2 fold differentially regulated; however, they have been retained as the results were reproducible and the T-test confirmed that the data were significant.

^a Annotation No. is that of Genbank genome annotation NC011761.

^bA 0.7 fold deviations from the 1:1 hybridization (\log_2) ratio are taken as indicative of differential gene expression.

^c Info on T-test and significance.

^dThe gene is in COG designation S (function unknown) but is included due to its gene context.

Fig. S1. Representative aerobic (A) and anaerobic (B) *Acidithiobacillus ferrooxidans* 2D-PAGE soluble protein gel and insets giving comparisons between aerobic (C) and anaerobic gels (D). 200 µg protein was applied to each gel. Differentially expressed protein spots circled (numbers refer to the spot IDs in Supplemental Table 1).

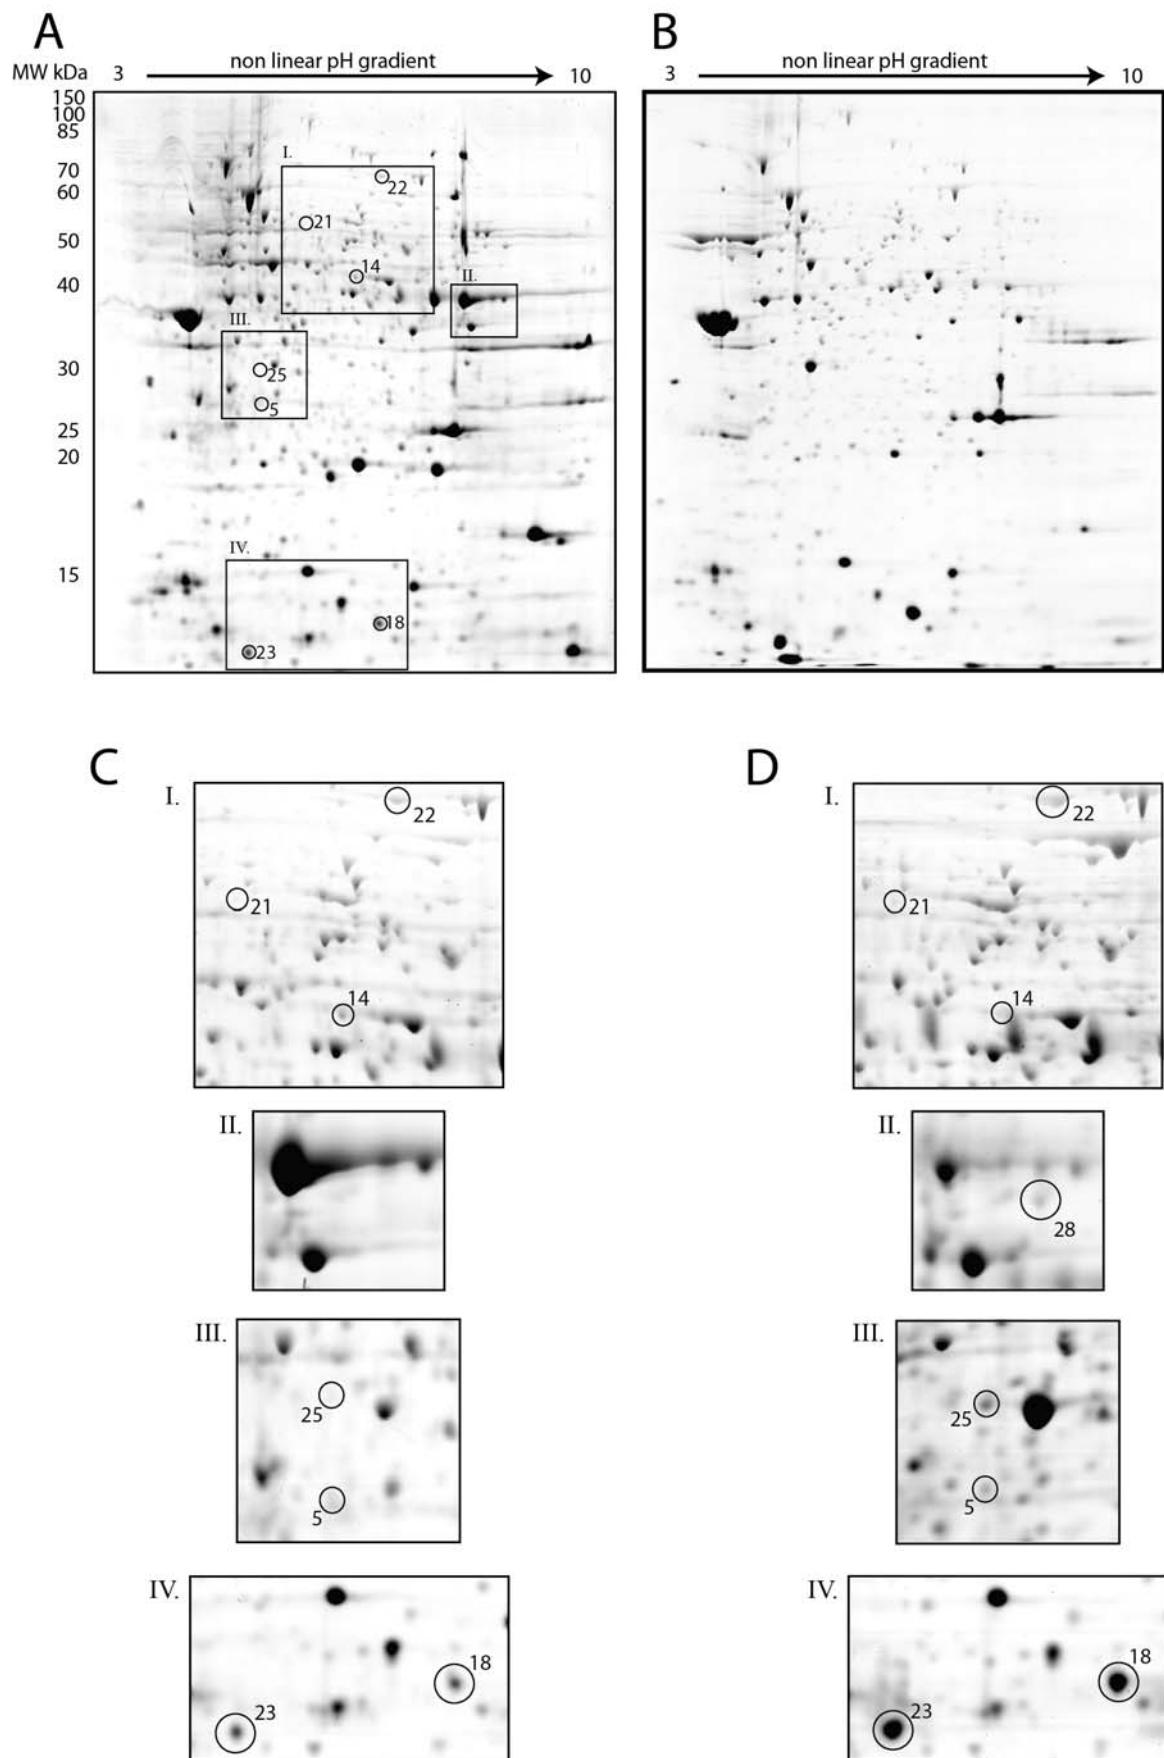

Fig. S2. Representative outer membrane protein enriched fraction (200 µg protein applied to each gel) of *Acidithiobacillus ferrooxidans* cultured aerobically (A) and anaerobically (B). Differentially expressed protein spots in (A) and (B) are circled with numbers referring to the spot IDs in Supplemental Table 1. In part A, only the spots which are up-regulated in aerobic conditions are shown whereas part B displays spots up-regulated in anaerobic conditions. A train of protein spots (OMPP1/FadL/TodX family protein, indicated by solid arrows in B) as well as one large spot (major outer membrane protein 40, indicated by open arrow in A, B) stand out against the general protein pattern. To avoid a skewed analysis of membrane enriched gels, five spots (arrowed with an asterisk) were excluded from the analysis.

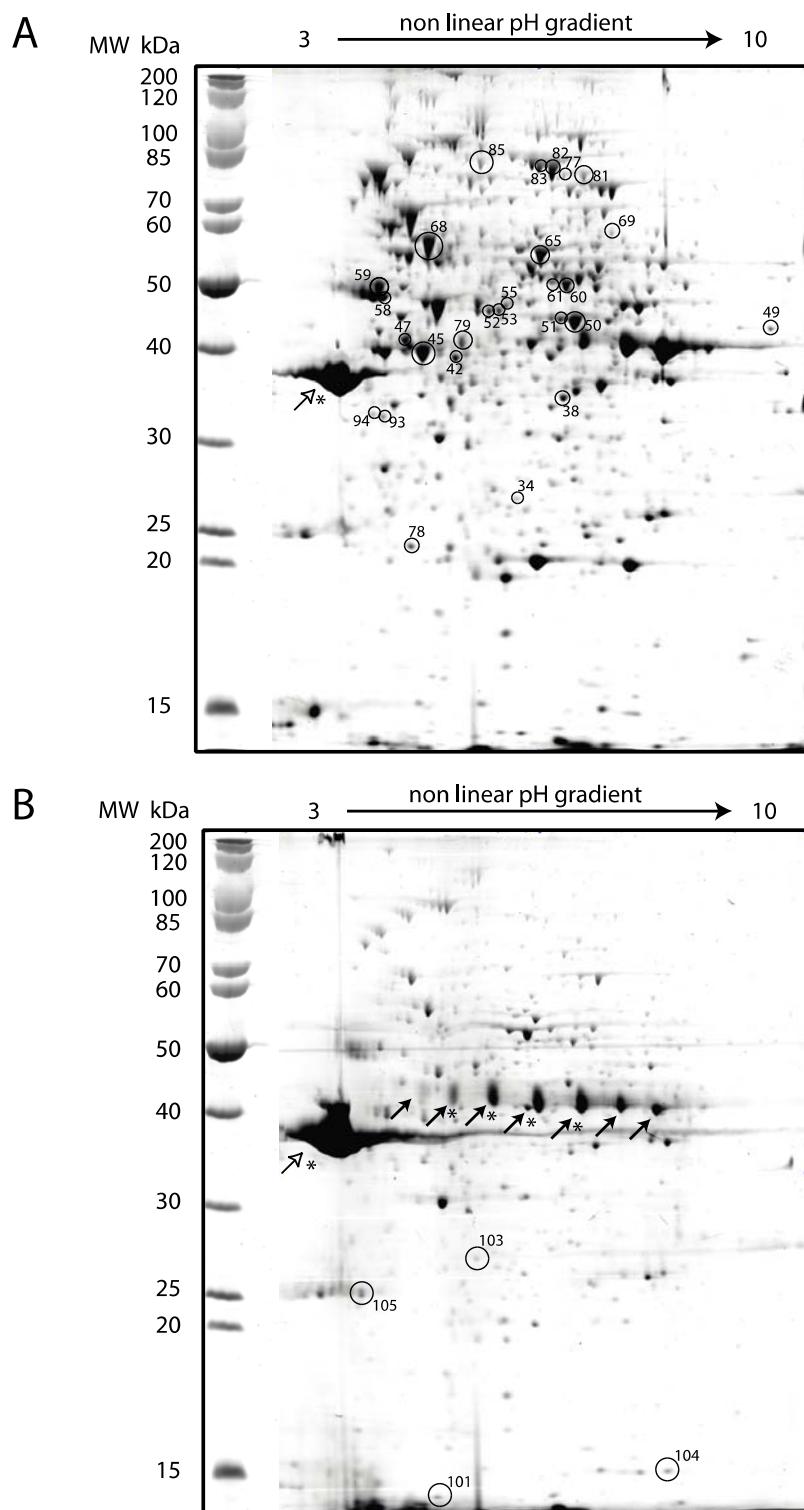

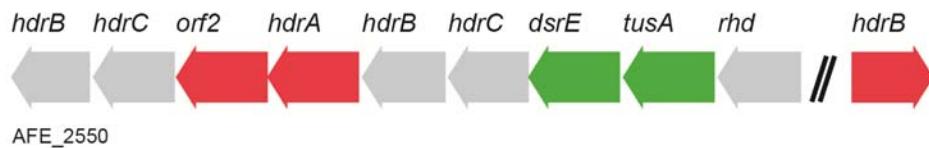

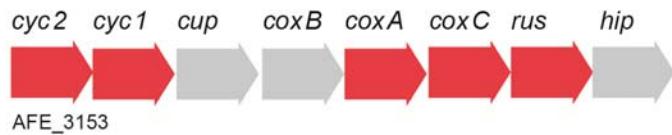

Fig. S3. Predicted genes and operons of energy metabolism and carbon management up-regulated in aerobic (red) and anaerobic (green) conditions. Genes that were not differentially expressed are in grey.
