

Figure 2 Supplementary

CD4⁺ T cells isolated from PBMC of 8 healthy donors were cultured at 10⁶/ml with autologous MDDC previously exposed to 10 μg/ml of uRBC-lysates (grey column) or *PfSE* (black column) at 20:1 T/DC ratio. IL10 and total TGF-β were measured in supernatants collected after 3 days (A) or after 5 days (B) of co-cultures by immunoplex array. Data are expressed as mean ± SE of cytokine production (n=8). Statistical analysis was performed by Student's T- test.
