

Supplemental Figure Legends:

- Supplemental Figure 1:** a) FACS plots showing how populations were defined, gated, and sorted for experiments. KSL: Lin- cKitHi Sca1+; CDP: Lin-, CD11c-, cKitlo, FcgRII/III-, Flt3+, CD115+; cDC: CD19-, CD3-, NK-, CD11c+ CD45RA-; pDC: CD19-, CD3-, NK-, CD11clo, CD45RA+; CMP: Lin- cKithi, Sca1-, CD34+, FcgRII/IIIlo/-; GMP: Lin- cKithi, Sca1-, CD34+, FcgRII/IIIhi; Myeloid/monocytes: CD19-, Mac1+, Gr1+; B lineage: Mac1-, CD3-, CD19+, CD45RA+. Splenic DC stained negative for other lineage markers (CD3, CD19 and NK-) but positive for expression of CD11c (as DCs express CD11c+), MHCII (for cDCs) and B220+ and/or PDCA-1+ (for pDC).
- b) CD19⁺ B lineage cells, CD11c⁺ DC, and Mac1⁺ Gr-1⁺ monocytes were sorted from pooled spleens of B6 control mice. 10⁵ cells were double sorted from each population and used for Western blot analysis to determine C/EBP α expression (top panel) as compared to HSP-90 (control, bottom panel).
- c) Immunofluorescence of sorted cell populations. 2x10⁵ cells were used to generate cytopsins. These slides were then fixed and stained for C/EBP α and DAPI from normal 8 week old mice (magnification, 1000). B cells were sorted as a negative control, whereas, monocytes are known to express C/EBP α .
- d) Immunofluorescence of cultured cell populations. 1x10⁶ cells were used to generate cultures for 7 days. Cell were placed onto slides and were then fixed and stained for CD11c, CD11b or CD8 and DAPI (magnification, 1000).
- e) FACS plots showing cDC and pDC from cultures at Day 7 from control or C/EBP α floxed whole bone marrow.

Supplemental Figure 2: Analysis of mice following deletion of C/EBP α .

- a) qRT-PCR showing loss of C/EBP α RNA in total lysed bone marrow 14 days after poly(IC) injection of MxCre- or MxCre+ C/EBP α floxed/floxed mice. The excision of C/EBP α was further confirmed by the loss of C/EBP α expression measured by quantitative RT-PCR. Following DNase treatment, RNA expression was assessed for C/EBP α and normalized to the housekeeping gene beta2-microglobulin using Taqman RT-PCR. Data are the mean \pm SD of four experiments.
- b) Bone marrow KSL (cKit $+$ Sca1 $+$ Lin $-$), CDP (Lin $-$, CD11c $-$, FcgRII/III $-$, cKit $+$, Flt3 $+$, CD115 $+$), or splenic myeloid cells (Gr1 $+$, Mac1 $+$) were gated from viable cells from MxCre-C/EBP α fl/fl or MxCre+C/EBP α fl/fl poly(IC) treated mice 14 days after the last of three injections.
- c) Viable cells from poly(IC) treated MxCre- or MxCre+ C/EBP α fl/fl mice 14 days after the last injection, dot plots show lack of MSCFR (CD115) expression and SSC-A high cells in C/EBP α fl/fl marrow cells.

Supplemental Figure 3: Deletion of C/EBP α in late stages of DC differentiation.

- a) Sorted DC from control (lanes 2, 3 and 5, 6) or CD11c-Cre x C/EBP α fl/fl (lanes 4, 5 and 8, 9) spleen were tested for excision of C/EBP α by PCR as described earlier. The ladder (far left) is 100bp with darker bands at 500bp and 1000bp and excised band should be present at ~400bp.
- b) Absolute numbers of cDCs pDCs were calculated from percentages of the cell populations defined as in (A, left panels) from total bone marrow, splenocytes, thymocytes and lymphnodes. The numbers of cDC represent mean \pm SD from three independent experiments with three mice per group.

c) CD11c-Cre+ x CEBP α fl/fl and CEBP α fl/fl mice were analyzed for the ability of DC to uptake antigen in vivo. Mice were injected i.p. with green fluorescent labeled 0.5-um latex beads and sacrificed after 16 hours. DC (CD19/B220-, CD3-, NK-, CD11c+) cells were analyzed for fluorescence distribution due to bead uptake. CEBP α fl/fl splenic DC had 18±5% fluorescence due to beads as compared to 22±4% in the CD11c-Cre+ x CEBP α fl/fl splenic DC. Data representative of 2 experiments each with 3 mice per group.

d) Analysis of RNA from cDC of CD11c-Cre+ C/EBP α fl/fl and C/EBP α fl/fl spleens was conducted using SABiosciences murine dendritic cell specific array. These populations were double sorted from CD11c-Cre+ and control mice and RNA was isolated following DNase treatment. The array plate is pre-coated with primers for DC specific transcripts. The plot shows the distribution of RNA detected compared to control. C/EBP α is highlighted by a red circle, confirming that it is indeed excised in the CD11c-Cre+ system and differs greatly in expression compared with control DC. A list of other significant genes that are decreased as well as increased can be seen listed to the right.

Supplemental Figure 4: Expression of PU.1 does not rescue DC differentiation from C/EBP α deficient KSL.

a) Expression of C/EBP α , C/EBP β , PU.1, IRF4, IRF8, Id2 by relative quantitative real-time RT-PCR of RNA from sorted KSL (cKit^{Hi}, Sca1⁺, Lin⁻). Values normalized to the control KSL. Data are averages of three independent experiments (error bars, s.e.m.).

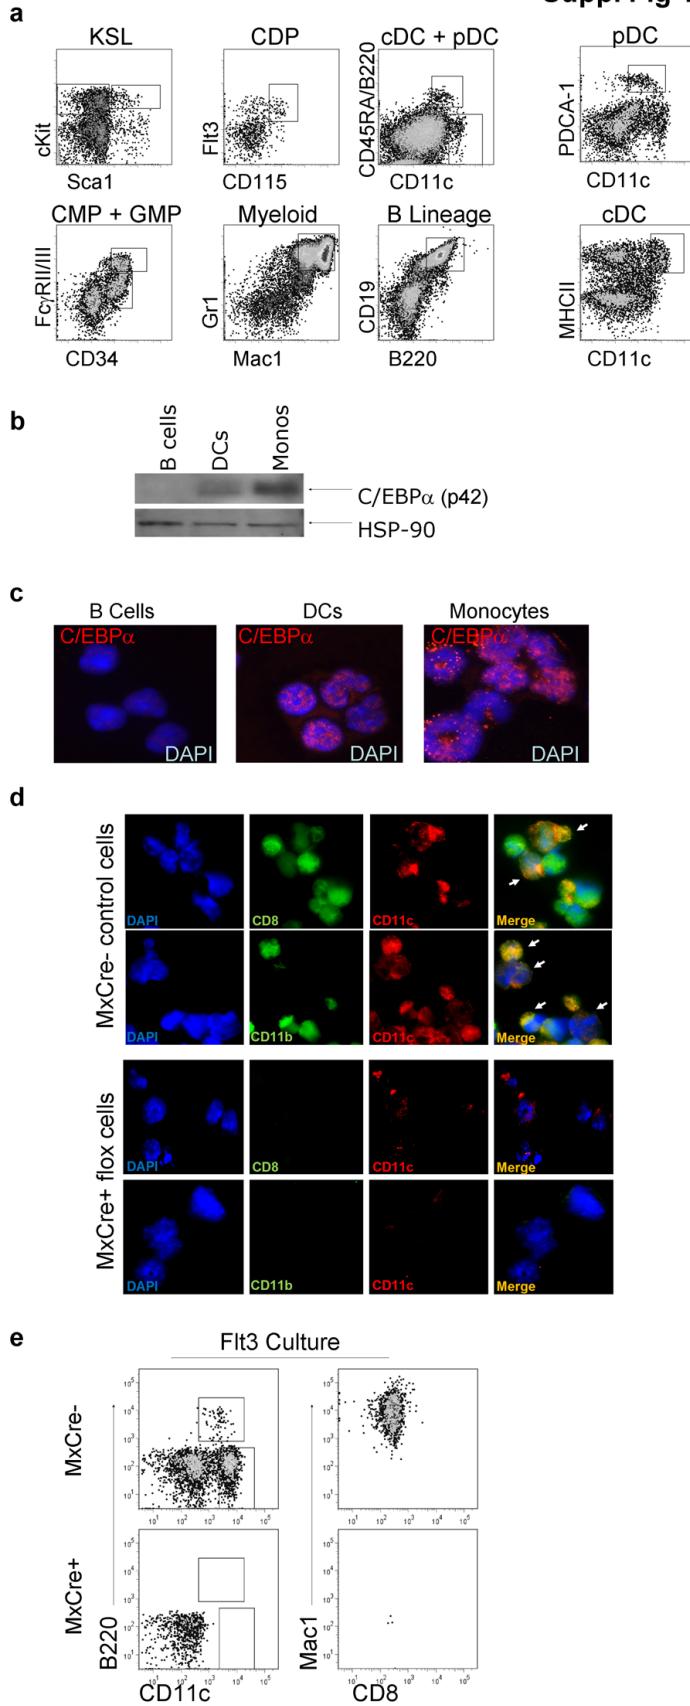

b) KSL from control or MxCre+ C/EBP α flox/flox or MxCre+ PU.1 flox/flox polyI:C treated mice were sorted and transduced with a retrovirus expressing PU.1-YFP. Cells were cultured in Flt3L differentiation conditions for 8 days. The top left panel shows typical numbers of YFP+ PU.1

expressing cells after transduction of KSL cells and culture. KSL from control mice uniformly differentiated into DC (top middle panel, with the box indicating CD11c+ cells. YFP+ C/EBP α deleted KSL can be seen in the top right panel (x-axis, CD11c; y-axis, FSC), but PU.1 alone could not rescue CD11c+ DC in KSL depleted for C/EBP α . PU.1 flox deleted KSL were used to demonstrate that the PU.1 retrovirus could rescue DC differentiation, bottom panels. These representative plots were taken from triplicate wells of two separate experiments.

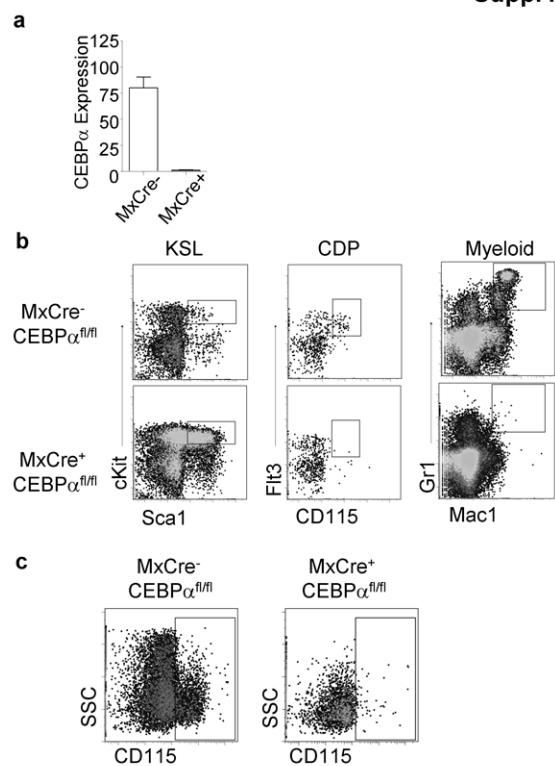

Supplemental Table 1: cDC (CD19/CD3/NK-, CD11c+ MHCII+) from CD11c-Cre+ C/EBP α fl/fl and C/EBP α fl/fl spleens were analyzed using SABiosciences murine dendritic cell specific array (PAMM-406A). This table lists of significant altered genes of 84 total that are decreased or increased in the CD11c-Cre x C/EBP α fl/fl splenic DC relative to control C/EBP α fl/fl splenic DC. These data are generated from Supplemental Figure 3C.

Supplemental Table 2: List of up and down regulated genes from array data comparing C/EBP α conditional knock-out MPP to CDP. Genes that were also expressed in MPP were subtracted as they may not pertain to dendritic cell differentiation. This approach was done using the dchip software, see Methods.
