Supplemental Figure 1 HDA15 specifically interacts with PIF3 in yeast. (A) Protein-protein interaction between PIF3 and HDACs in yeast cells. Full length cDNAs of HDACs and PIF3 were fused with AD and BD vectors, respectively. (B) Protein-protein interaction between HDA15 and PIFs (PIF3, PIF4 and PIF5) in yeast cells. The constructs were cotransformed into the yeast strain AH109 and plated on SD/-Leu-Trp medium. The transformants were then plated on SD/-Leu-Trp-His plus x-a-gal medium to detect the interaction. 0.1 mM 3 AT was added to repress the auto-activation of PIF3 bait (BD-PIF3).

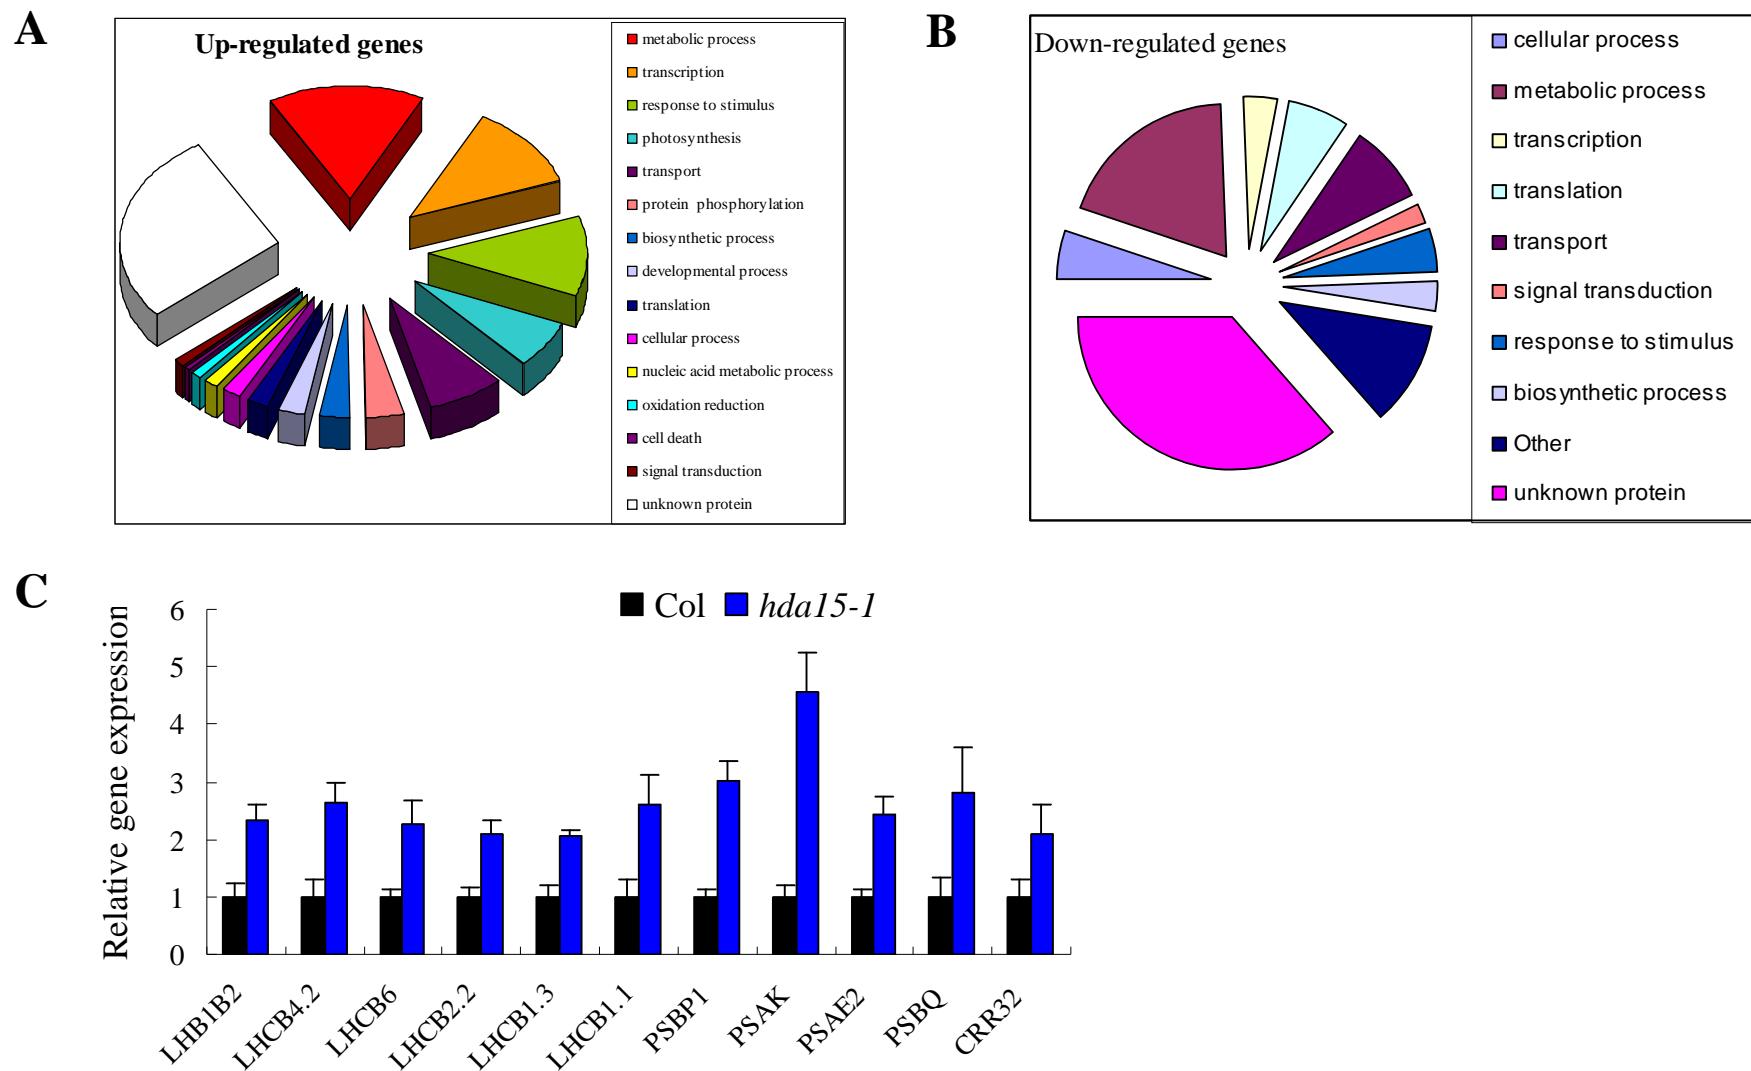

Supplemental Figure 2. HDA15 interacts with PIF3 in tobacco epidermal cells in dark. PIF3 and HDA15 fused with the N-terminus (YN) and the C-terminus (YC) of YFP were cotransfected into tobacco leaves with *Agrobacterium* strains (GV3101) and then incubated in dark (D) or red light (RL) at $10 \mu\text{mol m}^{-2}\text{s}^{-1}$ for 2 days.

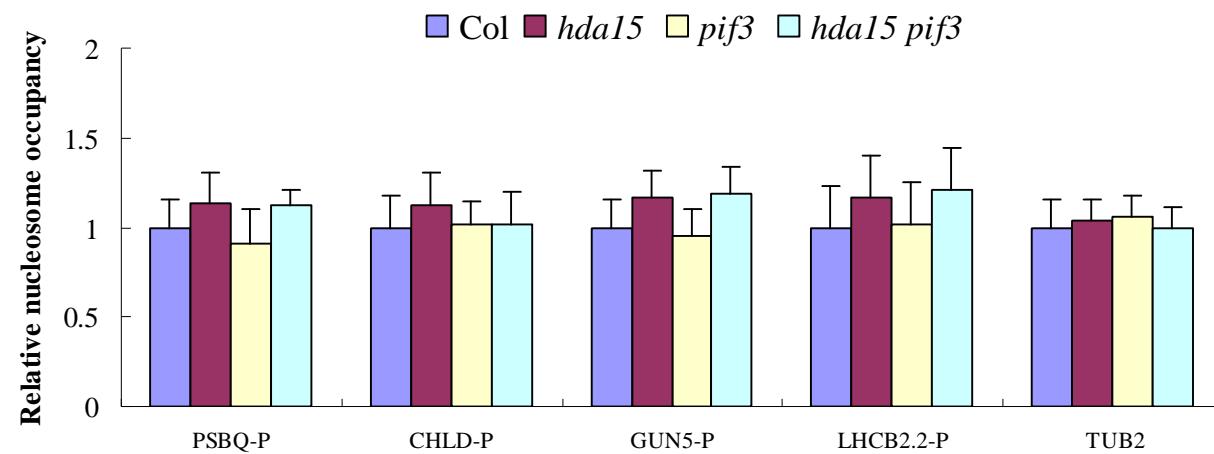

Supplemental Figure 3. HDA15 is constitutively localized in the nucleus under dark or light conditions. (A) Subcellular localization of HDA15 in 4-day-old transgenic plants (35S: *HDA15-GFP*). WL, white light, 100 $\mu\text{mol m}^{-2}\text{s}^{-1}$, (B) Subcellular localization of HDA15-GFP when etiolated seedlings transferred to the RL (10 $\mu\text{mol m}^{-2}\text{s}^{-1}$). Cell walls are stained by propidium iodide.

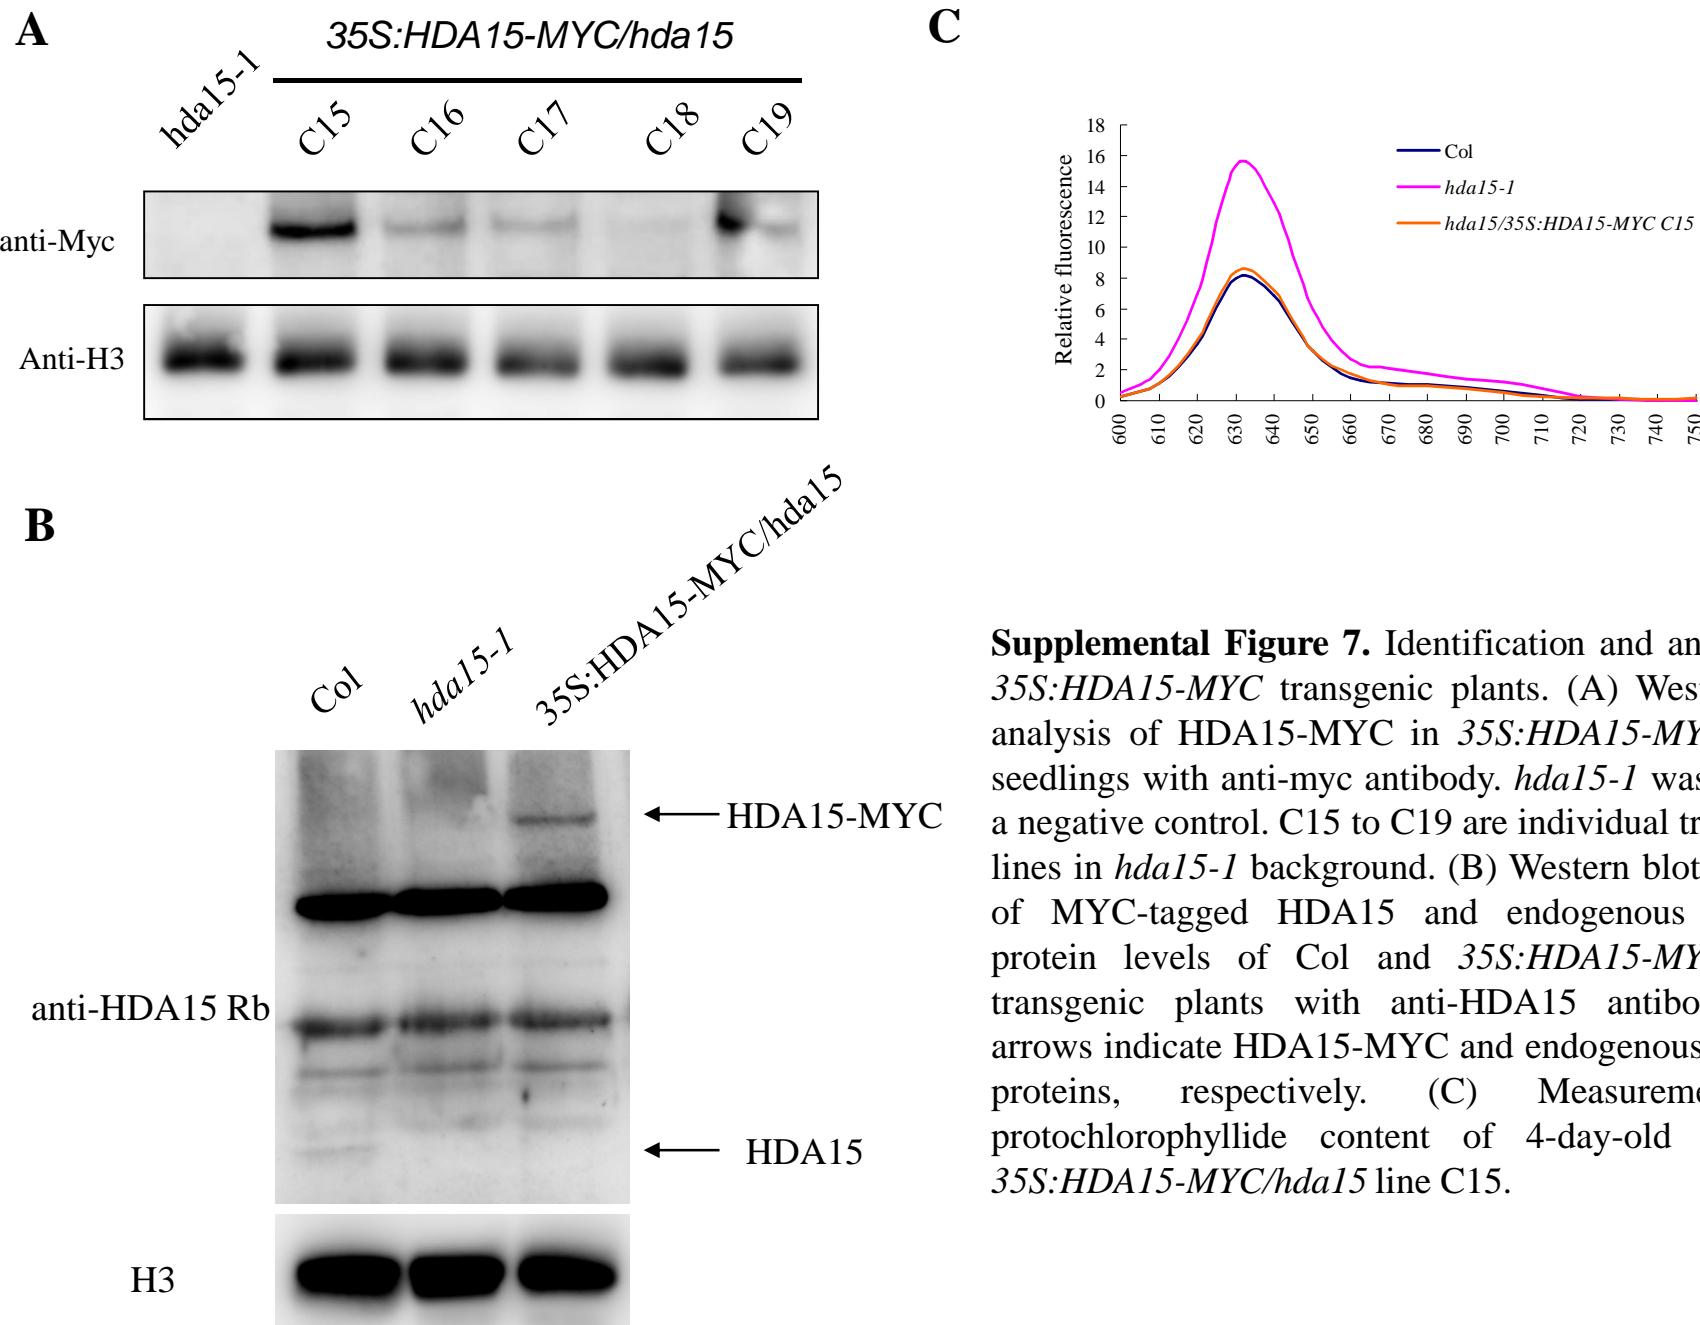

Supplemental Figure 4. Expression profiles of genes involved in the chlorophyll biosynthetic pathway in *hda15-1*. (A) A diagram of chlorophyll biosynthesis pathway. (B) Relative expression levels of genes involved in chlorophyll biosynthesis in *hda15-1* seedlings compared with *Col* seedlings grown in darkness for 2 days. The values are shown as means \pm SD.

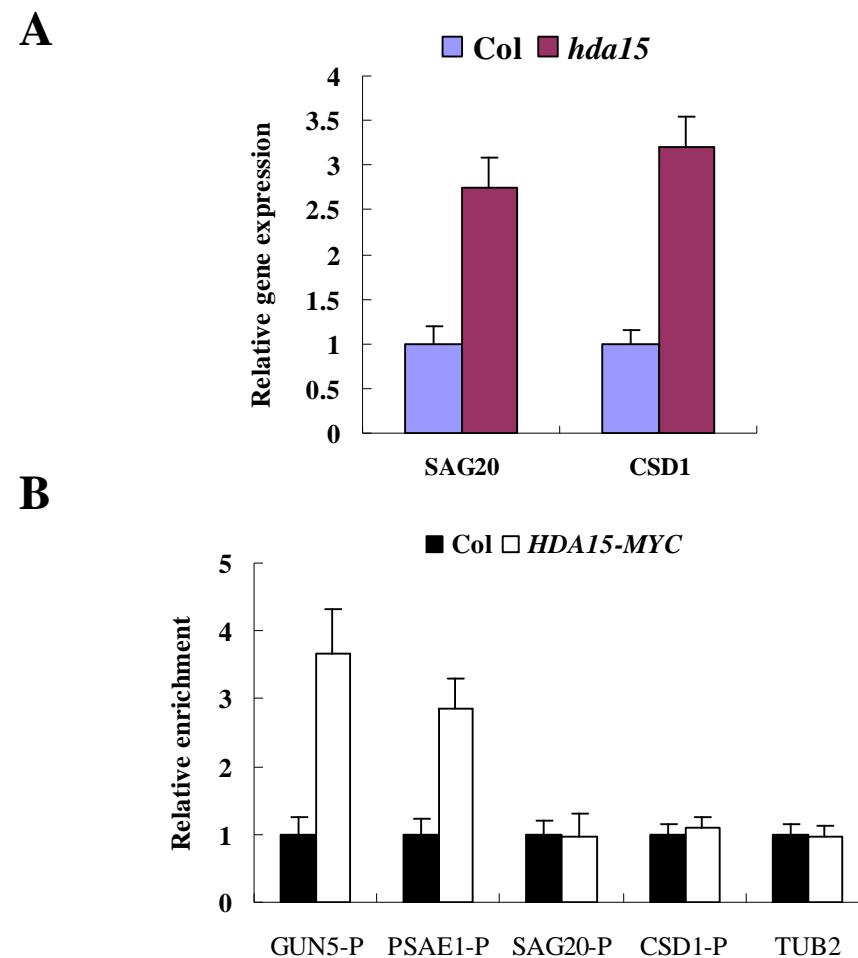

Supplemental Figure 5. Microarray analysis of HDA15 regulated genes in 2 day etiolated seedlings. (A, B) Up- and down-regulated genes in *hda15-1* seedlings. (C) qRT-PCR validation of genes expression detected by microarray analysis. *UBQ10* was used as a internal control. The values are shown as means + SD.

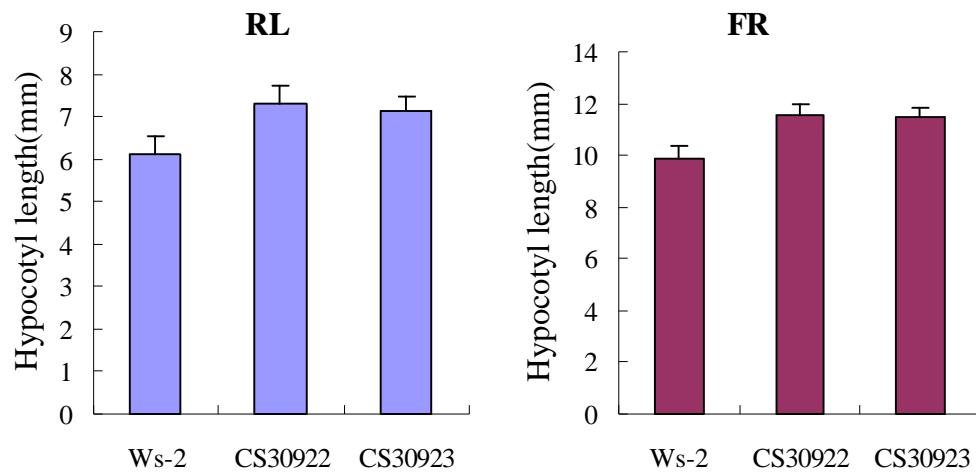

Supplemental Figure 6. Nucleosome occupancy analysis of the chlorophyll biosynthetic and photosynthetic genes in etiolated *Col*, *hda15*, *pif3* and *hda15pif3* seedlings. ChIP-qPCR analysis of DNA fragments co-immunoprecipitated with the anti-H4 antibody relative to *Col*. *TUB2* was used as a control. P indicated the promoter regions of the genes. The amounts of DNA after ChIP were quantified and normalized to *ACTIN2*. The values are shown as means + SD.

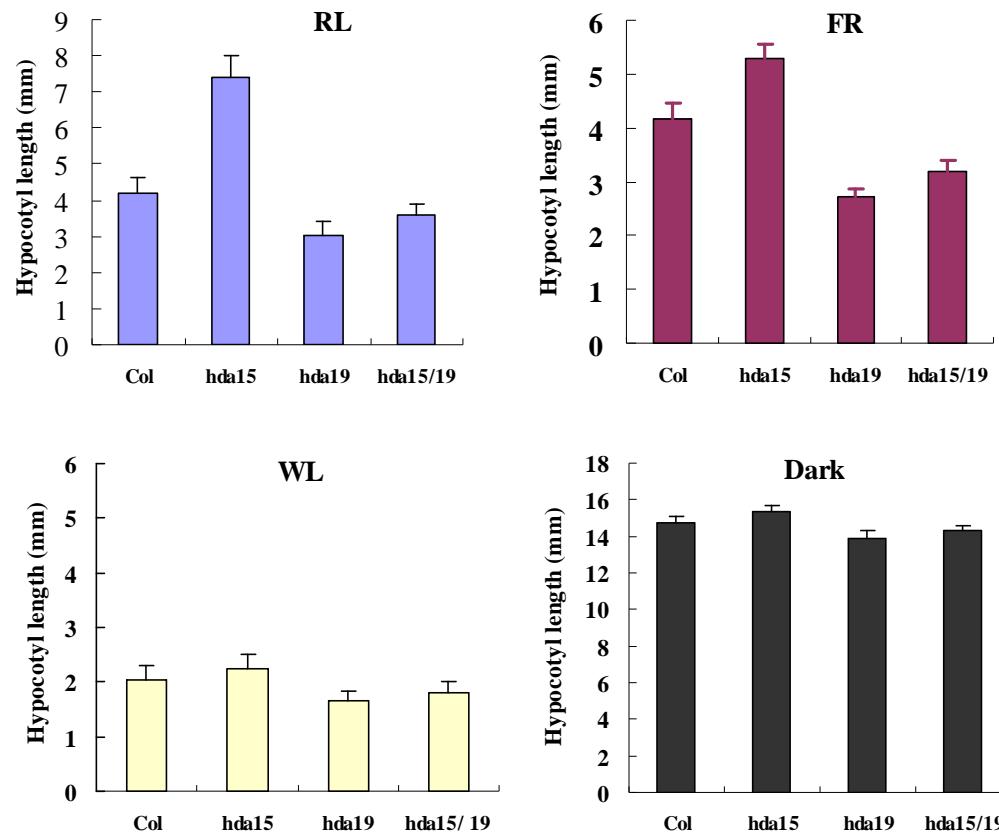

Supplemental Figure 7. Identification and analysis of 35S:HDA15-MYC transgenic plants. (A) Western blot analysis of HDA15-MYC in 35S:HDA15-MYC/hda15 seedlings with anti-myc antibody. *hda15-1* was used as a negative control. C15 to C19 are individual transgenic lines in *hda15-1* background. (B) Western blot analysis of MYC-tagged HDA15 and endogenous HDA15 protein levels of Col and 35S:HDA15-MYC/hda15 transgenic plants with anti-HDA15 antibody. The arrows indicate HDA15-MYC and endogenous HDA15 proteins, respectively. (C) Measurement of protochlorophyllide content of 4-day-old etiolated 35S:HDA15-MYC/hda15 line C15.

Supplemental Figure 8. Detection and validation of HDA15 target genes. (A) qRT-PCR analysis of genes expression detected by microarray analysis. *UBQ10* was used as a internal control. The values are shown as means + SD. (B) ChIP-qPCR analysis of DNA fragments co-immunoprecipitated with the anti-myc antibody relative to Col. *TUB2* was used as a control. P indicated the promoter regions of the genes. The amounts of DNA after ChIP were quantified and normalized to *ACTIN2*. The values are shown as means + SD.

Supplemental Figure 9. Phenotypic analysis *HDA15* RNAi seedlings (CS30922 and CS30923) grown in RL and FR for 4 days. RL, $2.5 \mu\text{mol m}^{-2}\text{s}^{-1}$, FR, $2 \mu\text{mol m}^{-2}\text{s}^{-1}$. The values are shown as means + SD.

Supplemental Figure 10. HDA15 and HDA19 antagonistically regulate hypocotyl elongation. Quantification of hypocotyl lengths of 4-day-old Col, *hda15*, *hda19* and *hda15/19* seedlings under various light conditions. RL, $10 \mu\text{mol m}^{-2}\text{s}^{-1}$, FR, $3.5 \mu\text{mol m}^{-2}\text{s}^{-1}$, WL, $100 \mu\text{mol m}^{-2}\text{s}^{-1}$. The values are shown as means + SD.

Supplemental Table 1. List of the genes that are induced in 2-day-old etiolated *hda15-1* and *pifq* (Leivar et al., 2009) seedlings relative to the wild-type.
