

Figure S3 Cross-species complementation using *C. neoformans* *PUT2* partially restored the proline utilization ability of the *S. cerevisiae* *put2Δ* mutant. Tenfold spot dilution assays for nitrogen source utilization showed that *C. neoformans* *PUT2* complemented the *S. cerevisiae* *put2Δ* mutant's proline assimilation defect, albeit to a poorer extent than an *S. cerevisiae* *PUT2*. On the other hand, neither *C. neoformans* *PUT1* or *PUT5* restored the proline utilization defect of the *S. cerevisiae* *put1Δ* strain.
