## Abstract

Objective: This study was undertaken to examine the role of gender as it relates to access to housing among individuals with severe mental illness (SMI) in Canada.

Design: An exploratory, qualitative approach was used to assess the perspectives of Canadian housing experts. The focus of inquiry was upon the role of gender and associated intersections (e.g., ethnicity) in pathways to housing access and housing needs for individuals with SMI.

Setting: A purposeful sampling strategy was undertaken to access respondents across all Canadian geographic regions, with diversity across setting (urban and rural), and service sector (hospital-based and community-based).

Participants: Twenty nine individuals (6 male and 23 female) considered to be experts regarding their housing service context as it pertains to SMI were recruited. On average, participants had worked for 15 years in services that specialized in the support and delivery of housing services to people with SMI.

Measures: Semi-structured interviews with participants focused on the role gender plays in access to housing in their specific context. Barriers and facilitators were examined as were intersections with other relevant factors, such as ethnicity, poverty, and parenthood. Quantitative ratings of housing accessibility as a function of gender were also collected.

Results: Participants across geographic contexts described a lack of shelter facilities for women leading to a reliance on exploitative circumstances. Other findings included a compounding of discrimination for ethnic minority women, the unique resource problems faced in rural contexts, and the difficulties that attend access to shelter and housing for parents with SMI.

1  
2  
3 Conclusions: These findings suggest that, along with a generally poor availability of housing  
4 stock for individuals with SMI, access problems are compounded by a lack of attention to the  
5  
6 unique needs and illness trajectories that attend gender.

### 10 11 12 Article Summary

#### 13 14 15 Article Focus:

- 16  
17 • To understand the role of gender in housing access among individuals with severe mental  
18 illness.  
19  
20

#### 21 22 Key Messages:

- 23  
24 • Misperceptions at policy and service system levels regarding the need for housing as a  
25 function of gender are leading to circumstances that compound the impacts of mental  
26 illness.  
27  
28
- 29 • Resource needs are particularly acute as additional points of marginalization emerge from  
30 factors such as ethnic minority status and rural context.  
31  
32
- 33 • Housing access problems have major impacts on the ability to parent as a person with  
34 severe mental illness.  
35  
36  
37  
38  
39

#### 40 41 Strengths and Limitations of this Study:

- 42  
43 • This study is among the first to directly address the interplay between housing access and  
44 gender among individuals with severe mental illness.  
45  
46
- 47 • The study accesses a broad, national range of expert perspectives.  
48  
49
- 50 • Transferability to other national contexts outside of Canada needs clarification.  
51  
52
- 53 • While serving the purpose of an initial inquiry, further work is needed to confirm and  
54 expand upon the assertions of the service providers interviewed here.  
55

1  
2  
3 The lack of adequate and affordable housing for individuals with severe mental illness  
4 (SMI) is repeatedly highlighted in research, public, and policy discourses. It is a complex  
5 problem rooted in individual and structural factors. Individuals with SMI often present with a  
6 complex array of concurrent psychiatric and chronic medical conditions which are often  
7 compounded by poverty, social exclusion, and substance misuse. Many structural factors also  
8 contribute to a lack of good-quality housing for people with SMI. Rent is often unaffordable,  
9 with costs typically taking up 70-90% of an individual's public benefits. This problem is  
10 exacerbated by Canada having just over 25,000 supported housing units available<sup>1</sup>. As a result,  
11 over 500,000 Canadians with mental illness are inadequately housed and an estimated 120,000  
12 are homeless<sup>1</sup>. This is a critical problem as adequate housing is a key determinant of health<sup>2</sup> and  
13 recovery<sup>3,4</sup>.

14  
15 From research and practice perspectives, challenges arise in the very generic articulation  
16 of the housing problem for the SMI population. Considerations of the issue of housing have very  
17 seldom taken into account the intersections of resource and adversity that attend factors such as  
18 gender, race, and ethnicity. As long as the specific mechanisms by which such factors, and their  
19 intersections, remain poorly understood, housing policies and programs for people with mental  
20 illness will remain inefficient and ineffective<sup>5</sup>. It is in light of this shortcoming in the SMI  
21 literature that the present study was undertaken to examine the role of gender in housing access  
22 in Canada.

### 23 *Gender and Severe Mental Illness*

24  
25 There are significant and pervasive differences between men and women with SMI that  
26 are present across the social determinants of health, illness onset and expression, and process of  
27 recovery. Taking schizophrenia as an example, women on average experience a later onset and  
28

57  
58  
59  
60

1  
2  
3 less severe course of illness, though suffer more depressive symptoms than men<sup>6</sup>. A later onset  
4  
5 of illness carries several important implications. Women typically have greater opportunities to  
6  
7 establish a range of competencies and a higher degree of independence before the illness  
8  
9 commences. This may account for generally stronger skills that support independent living and  
10  
11 longer periods of community tenure<sup>7,8</sup>.  
12  
13

14  
15 Women with SMI also have been found to more actively seek social contact and support,  
16  
17 which may have implications for less dependence on service providers and greater success in  
18  
19 living independently<sup>7,9</sup>. Men with SMI are, in turn, more likely to be homeless<sup>10</sup> and more reliant  
20  
21 upon health services<sup>9</sup> which may account for a further deterioration of independent living  
22  
23 skills<sup>11</sup>.  
24  
25

26  
27 Women with SMI also face several unique and prominent sources of adversity. Women  
28  
29 are more likely to have experienced childhood abuse and trauma and symptoms of PTSD<sup>12</sup>.  
30  
31 Women also experience higher rates of coercive sexual encounters and sex trade involvement as  
32  
33 means of coping with poverty and homelessness<sup>13</sup>. Furthermore, women have a greater  
34  
35 likelihood of having been socialized into passive and otherwise dependent roles, which may be  
36  
37 reified through service providers working within models of care that cultivate dependency<sup>7</sup>. Such  
38  
39 sociocultural factors are evident across a range of studies. For example, compared to women  
40  
41 without SMI, those with SMI place a greater importance on having caring and compassionate  
42  
43 providers than providers who encourage choice and independence<sup>14</sup>. Women with SMI are also  
44  
45 more likely to be perceived by family and other supports as more emotionally vulnerable and  
46  
47 irrational in comparison to men<sup>15,16</sup>.  
48  
49  
50  
51

52  
53 Pregnancy and child rearing is an additional consideration for women with SMI.  
54  
55 Typically framed in the context of enhancing risk, having a child has numerous implications  
56  
57  
58  
59  
60

1  
2  
3 around risks of medications in pregnancy and stressors associated with childrearing as poverty  
4 and illness threaten custody<sup>17</sup>. This is an increasingly relevant issue given evidence that the  
5  
6 fertility rate among Canadian women with Schizophrenia is on the rise<sup>18</sup>.  
7  
8  
9

10 Much less developed in the literature is attention to intersections of risk and resilience  
11 that attend the intersections of race, ethnicity, sexual and gender identity. Preliminary work  
12 suggests that these points of diversity have very important implications. While unique points of  
13 resilience emerge among these populations, recovery is typically complicated by multiple forms  
14 of discrimination and marginalization, and treatment needs that are seldom adequately met<sup>19,20</sup>.  
15  
16  
17  
18  
19  
20  
21

### 22 *The Present Study*

23  
24 Despite the consistent threads of evidence suggesting differences in mental illness  
25 etiology, expression, and recovery process as a function of gender, as a topic it is largely  
26 relegated to sidenote status in community mental health research and policy dialogues. This  
27 shortcoming is particularly evident in considerations of housing individuals with SMI. As such,  
28 this qualitative study was undertaken as an initial step to better articulating community service  
29 needs in Canada as a function of gender. Key informant interviews were undertaken with service  
30 providers across Canadian provinces and territories, in both hospital and community service  
31 sectors, and across both large urban, mid-sized city, and rural contexts.  
32

### 43 *Methods*

#### 44 *Recruitment*

45  
46 In order to obtain a broad, national perspective on gender equity within the housing  
47 sector for people with SMI, service providers were sought in provinces and territories in all  
48 geographic regions. The recruitment strategy targeted balanced representation as a function of  
49 setting, with interviews conducted with providers working in the largest urban centres in Canada  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 as well as representative small to mid-sized towns and cities. Representativeness of smaller  
4  
5 centres was determined by a consensus of the urban providers (the inquiry starting point in each  
6  
7 province/territory), seeking settings that were neither disproportionately over nor under-resourced.  
8  
9 Balance was also sought in respondent service sector, seeking representation from both hospital-  
10  
11 based and community-based organizations.  
12  
13

14  
15 Participant eligibility relied primarily on their being regarded as an individual who is  
16  
17 highly knowledgeable regarding access to housing and community services for people with SMI.  
18  
19 Recruitment started in large urban centres, with participants recommended through sources such  
20  
21 as key informants in the Mental Health Commission's recently completed consultation on  
22  
23 housing and the At Home study. Large urban setting respondents were then asked to provide  
24  
25 recommendations regarding experts in smaller settings. Recruitment continued until each region  
26  
27 was adequately represented and qualitative themes had attained saturation with subsequent  
28  
29 interviews revealing no new information. The study was reviewed and approved by an  
30  
31 institutional research ethics board.  
32  
33  
34  
35

### 36 37 *Procedure*

38  
39 Interviews lasting an average of 45 minutes were conducted with all participants via  
40  
41 telephone and were audio-recorded and transcribed verbatim. Demographic data collected for  
42  
43 each participant included geographical location, type of service, number of years in current post,  
44  
45 number of years working within mental health and housing sectors, gender, and profession. The  
46  
47 interview then moved on to explore participant perspectives and experiences pertaining to  
48  
49 differences regarding *access to, experiences within, and needs for* housing and associated  
50  
51 resources as a function of gender.  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 The interview concluded with 2 items that were developed to quantify service provider  
4 perceptions regarding access to housing as a function of gender (e.g., In a broad, general sense,  
5 how accessible is affordable housing for women/men with SMI in your city/town?) Participants  
6 were asked to score each item using a 5 point likert scale where 1 represented 'completely  
7 inaccessible' and 5 represented 'completely accessible'. This scale was developed for this study  
8 as we were unable to identify an existing, validated tool for this purpose.  
9  
10  
11  
12  
13  
14

### 17 *Analysis*

18  
19 While not a complete grounded theory design, the analysis followed the rigorous  
20 thematic analysis procedure outlined by Charmaz<sup>21,22</sup>, beginning with line by line coding of the  
21 data to pull out key, recurrent themes. Coding was reviewed with the research team at various  
22 stages of the analysis allowing for data to be contextualized and different interpretations  
23 explored. Analysis then moved onto focused coding, where conceptual analysis took place, and  
24 patterns amongst and relationships between the most relevant and salient categories became the  
25 focus. Emergent themes were shared in subsequent interviews for feedback and further  
26 exploration, which allowed for an ongoing process of member checking and elaboration of the  
27 analysis. Quantitative data was examined descriptively with mean differences examined through  
28 independent samples t-test analysis.

## 43 Results

### 44 *Participants*

45  
46 Twenty nine participants were recruited into the study (6 male and 23 female). All  
47 participants had worked within the mental health sector, ranging from between 1 to 30 years,  
48 with 20 years being the average length of service. Most worked in either director level or direct  
49 service positions, at 45 and 31 per cent respectively, with the remainder working in middle  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 management. On average, participants had worked for 15 years in services that specialized in the  
4 support and delivery of housing services to people with SMI. Most were regulated professionals  
5  
6 in areas such as Social Work or Counseling and 59 per cent were members of local advisory  
7  
8 committees and boards related to housing. Table 1 provides a detailed summary of participant  
9  
10 demographics.  
11  
12  
13

### 14 15 *Ratings of Accessibility*

16  
17 Quantitative measures of participant perceptions regarding housing access revealed a  
18 mean score for women of 2.0/5 (SD=0.68) and for men of 2.3/5 (SD=.86), a difference which  
19  
20 was not statistically significant ( $t=1.53, p=.13$ ). Qualitative consideration of rating differences as  
21  
22 a function of service sector (hospital versus community) and setting (large urban versus  
23  
24 town/small city) revealed minimal difference for both women (difference of +/- 0.1) and men  
25  
26 (difference +/- 0.3).  
27  
28  
29  
30

### 31 32 *Qualitative Findings*

33  
34 Participants uniformly regarded housing as the basic source of 'stability' and key health  
35  
36 determinant that is equally relevant for men and women with SMI. Numerous, generic themes  
37  
38 recurred such as the comments on low levels of housing stock, the limited availability and  
39  
40 allocation of funding to develop and sustain adequate housing, and client difficulties in obtaining  
41  
42 and maintaining adequate sources of income with which to cover rent and other basic expenses.  
43  
44 Across service sectors and geographic region, the context of supporting individuals with SMI  
45  
46 was described as one of pronounced financial strain.  
47  
48  
49

50  
51 Despite several cross-cutting similarities, these key-informant narratives of poverty,  
52  
53 under-resourced housing service sectors, and stigma differed markedly as a function of gender,  
54  
55 ethnicity, and other points of intersection. Erroneous assumptions about service needs and  
56  
57  
58  
59  
60

1  
2  
3 stigmatization were described as having a structural impact upon housing access. As will be  
4  
5 described, this resulted in unique pathways of marginalization, victimization, and poverty.  
6  
7

8 *“Structural” Adversity: Cycles of Invisibility, Lack of Access, and Vulnerability*  
9

10 Women were frequently referred to as the “invisible homeless”. Participants described  
11  
12 how the perceived absence of homeless women and the perception of homeless men as more  
13  
14 troublesome influenced policy, funding and service provision, resulting in woman having to  
15  
16 “turn to different systems than the formalized system” such as “couch surfing” with families,  
17  
18 friends and often with unknown men. While one provider found women’s ability to seek  
19  
20 alternative routes as “resourceful”, most voiced the opinion that the lack of shelter or emergency  
21  
22 housing for women increased their vulnerability. For example, women with SMI would “trade  
23  
24 sex for somewhere to stay” and “take somebody [in an exploitative context] in to help them pay  
25  
26 the rent when they’re feeling under pressure because of the costs.” For the majority, this was a  
27  
28 question of powerlessness rather than one of resourcefulness.  
29  
30  
31  
32  
33

34 “Women’s [with SMI] homelessness tends to be a little bit more invisible. We certainly  
35  
36 have a number of women who have lived with their sister for a long time or crashed with  
37  
38 unsavory males over a series of years. They have, in fact, been homeless they have just  
39  
40 been temporarily couched. If you look at resource availability ...they operate out of  
41  
42 men’s shelters, and aren’t always in a safe environment for women. [Resources] certainly  
43  
44 seem to be centered on male-accessible places...all these guys have all these shelters to  
45  
46 choose from and if they get booted out of one after four weeks they just move over to the  
47  
48 next one. We turn hundreds and hundreds of women away from our shelter because we  
49  
50 just don’t have the beds.”  
51  
52  
53

54 [Community service provider, small town in Central Canada]  
55  
56  
57  
58  
59  
60

1  
2  
3 Women were described as being pushed into a vicious cycle of unstable housing and  
4 increasingly stressful environments which led to poorer mental health, quality of life, and little  
5 access to community services. This cycle was compounded in smaller towns, as women had to  
6 leave for larger cities where there was better access to mental health and housing services.  
7  
8  
9  
10  
11

12 While men with SMI were described as having relatively greater access to housing and  
13 shelter, and experiencing less victimization and sexual exploitation, they are in no way immune  
14 to the dynamics of poverty and marginalization. They were described as typically being forced to  
15 live in “drug infested” areas due to stigma and poverty. Living in such neighbourhoods leads to  
16 high levels of anxiety among both men and women, and participants describe this as greatly  
17 increasing the risk of a relapse.  
18  
19  
20  
21  
22  
23  
24  
25

### 26 *The Intersection of Gender and Ethnicity*

27  
28  
29 Belonging to an ethnic minority group acted as a further source of marginalization, not  
30 just within hospital and community services but also within people’s own ethnic groups. The  
31 evidence of “blind spots” which fuelled gender and ethnic discrimination were evident mostly in  
32 the experiences of women.  
33  
34  
35  
36  
37

38  
39 “I’m thinking of one woman in particular who was from Pakistan and had been married  
40 most of her life but recently divorced and found herself on her own and with no place to  
41 live. I remember taking her to the shelter just before Christmas and she walked in her  
42 head scarf into this predominately male shelter waiting area and you could just feel it, it  
43 was very striking the degree to which she didn’t fit in.”  
44  
45  
46  
47  
48  
49

50 [Community service provider, urban area in Northern Canada]  
51

52  
53 For Aboriginal people living in rural Canada and the northern territories, the level of  
54 discrimination experienced by women with SMI was described as particularly heightened.  
55  
56  
57  
58  
59  
60

1  
2  
3 Geography and location, intersecting with gender, ethnicity, and intergenerational trauma, meant  
4  
5 that women were trapped in situations compounded by lack of transportation and an inability to  
6  
7 leave town.  
8  
9

10 “We worked with a woman from a small Aboriginal community. Her non-Aboriginal  
11  
12 husband got on the housing authority board and illegally had her name removed from  
13  
14 home ownership papers just because the government could. She didn’t win, because even  
15  
16 lawyers are racist in the territories...so in small communities it is very controlled by men  
17  
18 and they will choose men over Aboriginal women...Aboriginal women are the most  
19  
20 marginalized.”  
21  
22

23  
24 [Community service provider, small town in Northern Canada]  
25  
26

27 In the Aboriginal service context, several participants noted a conflict between the  
28  
29 community and hospital sectors, in that “psychiatrists, psychologists, and nurses” who are  
30  
31 considered “mainstream” were not using a “culturally competent approach”, which resulted in a  
32  
33 “racist” approach to care. These dissonances between community and hospital services created a  
34  
35 discontinuity in care and impeded the recovery of Aboriginal women. Providers talked about  
36  
37 how the “structural oppression” was internalized by women, who began to “talk about it like it’s  
38  
39 their fault”, and used words such as “loser” and not having the “smarts or self control” to  
40  
41 improve their lives.  
42  
43  
44

#### 45 46 *Men, Perceptions of Risk, and Housing Quality* 47

48 While participants described the impact stigma had on both men and women, their  
49  
50 narratives emphasized the manner in which it pervaded men’s experiences. They described how  
51  
52 the level of “trouble” and “risk” perceived by providers seemed to shape the transitioning and  
53  
54 access to community housing for men with severe mental illness. It was perceived as a “reality  
55  
56  
57  
58  
59  
60

1  
2  
3 that men are more prone to violence” compared to women, who were often viewed as “easier  
4  
5 tenants.”  
6

7  
8 “More men end up without housing because as part of their illness they’re maybe using  
9  
10 more and tend to be more aggressive ... landlords are more afraid. I mean we definitely  
11  
12 have women that have been quite agitated but I think landlords tend to be more accepting  
13  
14 of females.”  
15

16  
17 [Hospital service provider, urban area in Western Canada]  
18

19  
20 Participants also described men as being subjected to more substandard levels of  
21  
22 accommodation, based on the perception that men “don’t care” about their homes and are  
23  
24 content with living in “dorm-like situations”.  
25

### 26 27 *Women, Children, and Families* 28

29  
30 There was a general perception across participant narratives that men with SMI seldom  
31  
32 had family responsibilities. For men with children, this left them at a disadvantage – if they had a  
33  
34 child they would have even greater difficulty in accessing suitable housing than their female  
35  
36 counterparts. The majority of the commentary in this topic, however, revolved around women’s  
37  
38 experiences. The presence of children created further complexity for women in the housing  
39  
40 system, oscillating between facilitating and hindering housing access, recovery, and community  
41  
42 participation. Access was described as improved by some participants based upon “the premise  
43  
44 that women, as child bearers, will require family housing.” Having children was also described  
45  
46 by some as facilitating greater access to services as their physical and mental health needs are  
47  
48 considered a priority by providers. Others, however, described women with children as having  
49  
50 greater difficulty accessing care due to childcare responsibilities and fears that their  
51  
52 circumstances of mental illness and victimization may lead to their children being taken into  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 custody. Additional challenges included having adolescent male children who are not allowed in  
4  
5 female-only housing and shelter settings, and “catch-22” scenarios that can make it nearly  
6  
7 impossible for impoverished women to regain custody once it is lost.  
8  
9

10 “So when a woman applies for housing, if they don’t have guardianship they can only  
11  
12 apply for a single even though they need a 3-bedroom to get their kids back...so maybe  
13  
14 she will get a one bedroom and is living in an overcrowded situation again...living in that  
15  
16 overcrowded place plays into the mental health of the parent and the children and that  
17  
18 creates the tension and starts to stir the pot. Then throw some alcohol on that, and then  
19  
20 starts the domestic violence, then she flees the violence, and the partner stays in the house  
21  
22 and she has to start the process all over again.”  
23  
24  
25

26 [Community service provider, urban area in Northern Canada]  
27  
28

29 This problem was described as unfolding differently within some Aboriginal  
30  
31 communities. For example, grandmothers were “rescuing” their grandchildren while mothers  
32  
33 were “couch surfing” and “people take in their adult children and adult grandchildren”.  
34  
35

### 36 Discussion 37 38

39 This study of housing expert perspectives was undertaken to describe the housing service  
40  
41 context for Canadians with SMI as a function of gender. It is an initial attempt to articulate these  
42  
43 issues in the Canadian context and advance the small, but growing knowledge base related to  
44  
45 gendered experiences of serious mental illness.  
46  
47

48 This study highlighted several problems. Biased perspectives regarding housing needs  
49  
50 were described as leading to women with SMI being forced into exploitative and victimizing  
51  
52 circumstances. Even when accommodating women, the emphasis on male-focused services was  
53  
54 described as being alienating and potentially risky for women to access. These findings are  
55  
56  
57  
58  
59  
60

1  
2  
3 reflective of literature that, while noting greater success with independent living among  
4 women<sup>7,8</sup>, also describe much higher rates of coercive sexual encounters and sex trade  
5 involvement<sup>13</sup>. Indeed, it brings forward the question of necessity in the greater levels of  
6 independence observed among women and whether, for many, purported observations of  
7 independence may overlie contexts of exploitation and victimization.  
8  
9

10  
11  
12  
13  
14  
15 Additionally, while the many stresses that attend having a child for women with SMI  
16 have been documented<sup>17</sup>, this study noted several implications for housing-related services.  
17 These included ambivalence about the net impacts for mothers with SMI. Some participants cited  
18 enhanced outreach and support extended to mothers and others describing mothers having less  
19 time to access services or actively avoiding services for fear of losing custody. Fear of losing  
20 custody of children was associated with women being forced into higher-risk living  
21 circumstances. Women who had lost custody were also described as struggling with catch-22  
22 scenarios in which they required adequate housing to regain custody but could not obtain it  
23 unless they had custody.  
24  
25  
26  
27  
28  
29  
30  
31  
32  
33  
34  
35

36 Men were also described as facing significant problems accessing adequate housing,  
37 albeit with some different factors involved. This was reflected in the finding men were  
38 comparably rated with women in terms of overall access to housing services. Men with SMI  
39 were understood to have difficulties accessing stable housing due to their being perceived as  
40 being more prone to disturbance and violence. Furthermore, there existed a perception that men  
41 cared less about the quality of housing and shelter spaces, resulting in their being provided with  
42 lower quality and, more frequently, large dormitory-type spaces. These findings are reflected in  
43 observation of greater rates of homelessness among males with SMI<sup>10</sup>.  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 While considered relatively rare, child custody was considered a pronounced challenge  
4  
5 for men as supports for families was described as almost exclusively geared towards single  
6  
7 parent women. This problem extended to women with teenaged male children who, if they  
8  
9 appeared too adult, were likely to be sent to separate shelters due to concerns that their presence  
10  
11 might disturb other female residents.  
12  
13

14  
15 Ethnicity and service sector size were generally described as compounding the housing  
16  
17 access problems faced by women. Consistent with previous work<sup>20</sup>, it was observed that  
18  
19 racialized women faced several forms of discrimination in male-oriented shelter and housing  
20  
21 systems. Concerns for Aboriginal women with SMI revolved around the pronounced lack of  
22  
23 access to housing and limited mobility that attend poverty in remote communities – risks that are  
24  
25 enhanced when political and service leadership structures are predominantly male. Conversely,  
26  
27 some providers spoke of small Aboriginal communities providing greater support to women with  
28  
29 SMI, with grandparents and other family members playing a greater role in care for children and  
30  
31 housing when needed.  
32  
33  
34  
35

36  
37 While the transferability of these findings will require further study that includes a closer  
38  
39 consideration of client perspectives and outcomes, the present findings point to a need for a  
40  
41 systematic examination of inequities in the Canadian housing service sector for people with SMI.  
42  
43 This group of Canadian housing experts observed structural forms of discrimination that were  
44  
45 compounded by poverty and mental illness within the context of an ongoing pervasive difficulty  
46  
47 in accessing adequate housing. As emphasized by Canada's mental health strategy<sup>23</sup>, until gender  
48  
49 and other key intersections such as ethnicity are better addressed our services will continue to  
50  
51 ignore major determinants of illnesses such as schizophrenia<sup>24,25</sup>.

## Abstract

Objective: This study was undertaken to examine the role of gender as it relates to access to housing among individuals with severe mental illness (SMI) in Canada.

Design: An exploratory, qualitative approach was used to assess the perspectives of Canadian housing experts. The focus of inquiry was upon the role of gender and associated intersections (e.g., ethnicity) in pathways to housing access and housing needs for individuals with SMI.

Setting: A purposeful sampling strategy was undertaken to access respondents across all Canadian geographic regions, with diversity across setting (urban and rural), and service sector (hospital-based and community-based).

Participants: Twenty nine individuals (6 male and 23 female) considered to be experts regarding their housing service context as it pertains to SMI were recruited. On average, participants had worked for 15 years in services that specialized in the support and delivery of housing services to people with SMI.

Measures: Semi-structured interviews with participants focused on the role gender plays in access to housing in their specific context. Barriers and facilitators were examined as were intersections with other relevant factors, such as ethnicity, poverty, and parenthood. Quantitative ratings of housing accessibility as a function of gender were also collected.

Results: Participants across geographic contexts described a lack of shelter facilities for women leading to a reliance on exploitative circumstances. Other findings included a compounding of discrimination for ethnic minority women, the unique resource problems faced in rural contexts, and the difficulties that attend access to shelter and housing for parents with SMI.

1  
2  
3 Conclusions: These findings suggest that, along with a generally poor availability of housing  
4 stock for individuals with SMI, access problems are compounded by a lack of attention to the  
5  
6 unique needs and illness trajectories that attend gender.  
7  
8  
9

### 10 11 12 Article Summary

#### 13 14 15 Article Focus:

- 16  
17 • To understand the role of gender in housing access and needs among individuals with  
18 severe mental illness.  
19  
20

#### 21 22 Key Messages:

- 23  
24 • Misperceptions at policy and service system levels regarding the need for housing as a  
25 function of gender are leading to circumstances that compound the impacts of mental  
26 illness.  
27  
28
- 29  
30 • Resource needs are particularly acute as additional points of marginalization emerge from  
31 factors such as ethnic minority status and rural context.  
32  
33
- 34  
35 • Housing access problems have major impacts on the ability to parent as a person with  
36 severe mental illness.  
37  
38  
39

#### 40 41 42 Strengths and Limitations of this Study:

- 43  
44 • This study is among the first to directly address the interplay between housing access and  
45 gender among individuals with severe mental illness.  
46  
47
- 48  
49 • The study accesses a broad, national range of expert perspectives.  
50
- 51  
52 • Transferability to other national contexts outside of Canada needs clarification as do  
53 potential biases attending respondents (i.e., primarily female provider perspectives, no  
54 consumer perspectives represented).  
55  
56  
57  
58  
59  
60

- While serving the purpose of an initial inquiry, further work is needed to confirm and expand upon the assertions of the service providers interviewed here.

Acknowledgments: This work was supported by a grant from the Canadian Institutes of Health Research. Appreciation is also extended to Dr. John Trainor and the Toronto Community Support and Research Unit of the Toronto Centre for Addiction and Mental Health (CAMH) and Dr. Paula Goering, CAMH.

Competing Interests Statement: No author of this study will in any way gain or lose financially from the results of this study. No author has been employed by an organisation that may in any way gain or lose financially from the results of this study. No authors hold any stocks or shares in an organisation that may in any way gain or lose financially from the results of this study. No author has acted as an expert witness on the subject of this study. No other competing financial interests exist.

1  
2  
3 The lack of adequate and affordable housing for individuals with severe mental illness  
4 (SMI) is repeatedly highlighted in research, public, and policy discourses. It is a complex  
5  
6 problem rooted in individual and structural factors. Individuals with SMI often present with a  
7  
8 complex array of concurrent psychiatric and chronic medical conditions which are often  
9  
10 compounded by poverty, social exclusion, and substance misuse. Many structural factors also  
11  
12 contribute to a lack of good-quality housing for people with SMI. Rent is often unaffordable,  
13  
14 with costs typically taking up 70-90% of an individual's public benefits. This problem is  
15  
16 exacerbated by Canada having just over 25,000 supported housing units available<sup>1</sup>. As a result,  
17  
18 over 500,000 Canadians with mental illness are inadequately housed and an estimated 120,000  
19  
20 are homeless<sup>1</sup>. This is a critical problem as adequate housing is a key determinant of health<sup>2</sup> and  
21  
22 recovery<sup>3,4</sup>.  
23  
24  
25  
26  
27  
28

29 From research and practice perspectives, challenges arise in the very generic articulation  
30  
31 of the housing problem for the SMI population. Considerations of the issue of housing have very  
32  
33 seldom taken into account the intersections of resource and adversity that attend factors such as  
34  
35 gender, race, and ethnicity. As long as the specific mechanisms by which such factors, and their  
36  
37 intersections, remain poorly understood, housing policies and programs for people with mental  
38  
39 illness will remain inefficient and ineffective<sup>5</sup>. It is in light of this shortcoming in the SMI  
40  
41 literature that the present study was undertaken to examine the role of gender in housing for  
42  
43 Canadians with SMI. This initial qualitative exploration draws upon housing expert perspectives  
44  
45 regarding service access and service needs as they intersect with gender, ethnicity, and  
46  
47 geographic context.

60

There are significant and pervasive differences between men and women with SMI that are present across the social determinants of health, illness onset and expression, and process of recovery. Taking schizophrenia as an example, women on average experience a later onset and less severe course of illness, though suffer more depressive symptoms than men<sup>6</sup>. A later onset of illness carries several important implications. Women typically have greater opportunities to establish a range of competencies and a higher degree of independence before the illness commences. This may account for generally stronger skills that support independent living and longer periods of community tenure<sup>7,8</sup>.

Women with SMI also have been found to more actively seek social contact and support, which may have implications for less dependence on service providers and greater success in living independently<sup>7,9</sup>. Men with SMI are, in turn, more likely to be homeless<sup>10</sup> and more reliant upon health services<sup>9</sup> which may account for a further deterioration of independent living skills<sup>11</sup>.

Women with SMI also face several unique and prominent sources of adversity. Women are more likely to have experienced childhood abuse and trauma and symptoms of PTSD<sup>12</sup>. Women also experience higher rates of coercive sexual encounters and sex trade involvement as means of coping with poverty and homelessness<sup>13</sup>. Coercion in relationships with male partners has also been extended to include influence upon the uptake of substance abuse and involvement in criminal activities<sup>14</sup>. Furthermore, women have a greater likelihood of having been socialized into passive and otherwise dependent roles, which may be reified through service providers working within models of care that cultivate dependency<sup>7</sup>. Such sociocultural factors are evident across a range of studies. For example, compared to women without SMI, those with SMI place a greater importance on having caring and compassionate providers than providers who

1  
2  
3 encourage choice and independence<sup>15</sup>. Women with SMI are also more likely to be perceived by  
4  
5 family and other supports as more emotionally vulnerable and irrational in comparison to  
6  
7 men<sup>16,17</sup>.  
8  
9

10 Pregnancy and child rearing is an additional consideration for women with SMI.  
11  
12 Typically framed in the context of enhancing risk, having a child has numerous implications  
13  
14 around risks of medications in pregnancy and stressors associated with childrearing as poverty  
15  
16 and illness threaten custody<sup>18</sup>. This is an increasingly relevant issue given evidence that the  
17  
18 fertility rate among Canadian women with Schizophrenia is on the rise<sup>19</sup>.  
19  
20  
21

22 Much less developed in the literature is attention to intersections of risk and resilience  
23  
24 that attend the intersections of race, ethnicity, sexual and gender identity. Preliminary work  
25  
26 suggests that these points of diversity have very important implications. While unique points of  
27  
28 resilience emerge among these populations, recovery is typically complicated by multiple forms  
29  
30 of discrimination and marginalization, and treatment needs that are seldom adequately met<sup>20,21</sup>.  
31  
32  
33

### 34 *The Present Study*

35  
36 Despite the consistent threads of evidence suggesting differences in mental illness  
37  
38 etiology, expression, and recovery process as a function of gender, as a topic it is largely  
39  
40 relegated to sidenote status in community mental health research and policy dialogues. This  
41  
42 shortcoming is particularly evident in considerations of housing individuals with SMI. As such,  
43  
44 this qualitative study was undertaken as an initial step to better articulating community service  
45  
46 needs in Canada as a function of gender. Key informant interviews were undertaken with service  
47  
48 providers across Canadian provinces and territories, in both hospital and community service  
49  
50 sectors, and across both large urban, mid-sized city, and rural contexts.  
51  
52  
53  
54

### 55 *Methods*

### *Recruitment*

In order to obtain a broad, national perspective on gender equity within the housing sector for people with SMI, service providers were sought in provinces and territories in all geographic regions. The recruitment strategy targeted balanced representation as a function of setting, with interviews conducted with providers working in the largest urban centres in Canada as well as representative small to mid-sized towns and cities. Representativeness of smaller centres was determined by a consensus of the urban providers (the inquiry starting point in each province/territory), seeking settings that were neither disproportionately over nor under-resourced. Balance was also sought in respondent service sector, seeking representation from both hospital-based and community-based organizations.

Participant eligibility relied primarily on their being regarded as an individual who is highly knowledgeable regarding access to housing and community services for people with SMI. Recruitment started in large urban centres, with participants recommended through sources such as key informants in the Mental Health Commission's recently completed consultation on housing and the At Home study. Large urban setting respondents were then asked to provide recommendations regarding experts in smaller settings. Recruitment continued until each region was adequately represented and qualitative themes had attained saturation with subsequent interviews revealing no new information. The study was reviewed and approved by the Toronto Center for Addiction and Mental Health institutional research ethics board (#183/2011).

### *Procedure*

Interviews lasting an average of 45 minutes were conducted with all participants via telephone and were audio-recorded and transcribed verbatim. Demographic data collected for each participant included geographical location, type of service, number of years in current post,

1  
2  
3 number of years working within mental health and housing sectors, gender, and profession. The  
4  
5 interview then moved on to explore participant perspectives and experiences pertaining to  
6  
7 differences regarding *access to, experiences within, and needs for* housing and associated  
8  
9 resources as a function of gender.  
10  
11

12  
13 The interview concluded with 2 items that were developed to quantify service provider  
14  
15 perceptions regarding access to housing as a function of gender (e.g., In a broad, general sense,  
16  
17 how accessible is affordable housing for women/men with SMI in your city/town?) Participants  
18  
19 were asked to score each item using a 5 point likert scale where 1 represented ‘completely  
20  
21 inaccessible’ and 5 represented ‘completely accessible’. This scale was developed for this study  
22  
23 as we were unable to identify an existing, validated tool for this purpose.  
24  
25

### 26 27 *Analysis*

28  
29 While not a complete grounded theory design, the analysis followed the rigorous  
30  
31 thematic analysis procedure outlined by Charmaz<sup>22,23</sup>, beginning with line by line coding of the  
32  
33 data to pull out key, recurrent themes. Line by line coding was completed by 1 coder with  
34  
35 category reports examined by a second research team member who also reviewed full transcripts  
36  
37 and recordings of interviews. Coding was reviewed at several stages of the analysis allowing for  
38  
39 data to be contextualized and different interpretations explored and resolved through consensus.  
40  
41 Focused coding, where conceptual analysis took place, commenced after 8 interviews when  
42  
43 coherent and consistent linkages between categories and themes began to emerge. Emergent  
44  
45 themes were shared in subsequent interviews for feedback and further exploration, which  
46  
47 allowed for an ongoing process of member checking and elaboration of the analysis. Quantitative  
48  
49 data was examined descriptively with mean differences examined through independent samples  
50  
51 t-test analysis.  
52

60

## Results

### *Participants*

Twenty nine participants were recruited into the study (6 male and 23 female). All participants had worked within the mental health sector, ranging from between 1 to 30 years, with 20 years being the average length of service. Most worked in either director level or direct service positions, at 45 and 31 per cent respectively, with the remainder working in middle management. On average, participants had worked for 15 years in services that specialized in the support and delivery of housing services to people with SMI. Most were regulated professionals in areas such as Social Work or Counseling and 59 per cent were members of local advisory committees and boards related to housing. Table 1 provides a detailed summary of participant demographics.

### *Ratings of Accessibility*

Quantitative measures of participant perceptions regarding global housing access revealed a mean score for women of 2.0/5 (SD=0.68) and for men of 2.3/5 (SD=.86), a difference which was not statistically significant ( $t=1.53$ ,  $p=.13$ ). Qualitative consideration of rating differences as a function of service sector (hospital versus community) and setting (large urban versus town/small city) revealed minimal difference for both women (difference of +/- 0.1) and men (difference +/- 0.3).

### *Qualitative Findings*

Participants uniformly regarded housing as the basic source of 'stability' and key health determinant that is equally relevant for men and women with SMI. Numerous, generic themes recurred such as the comments on low levels of housing stock, the limited availability and allocation of funding to develop and sustain adequate housing, and client difficulties in obtaining

1  
2  
3 and maintaining adequate sources of income with which to cover rent and other basic expenses.

4  
5 Across service sectors and geographic region, the context of supporting individuals with SMI  
6  
7 was described as one of pronounced financial strain.  
8  
9

10 Despite several cross-cutting similarities, these key-informant narratives of poverty,  
11 under-resourced housing service sectors, and stigma differed markedly as a function of gender,  
12 ethnicity, and other points of intersection. Erroneous assumptions about service needs and  
13 stigmatization were described as having a structural impact upon housing access. As will be  
14 described, this resulted in unique pathways of marginalization, victimization, and poverty.

17  
18  
19  
20  
21

22 *“Structural” Adversity: Cycles of Invisibility, Lack of Access, and Vulnerability*  
23

24 Women were frequently referred to as the “invisible homeless”. Participants described  
25 how the perceived absence of homeless women and the perception of homeless men as more  
26 troublesome influenced policy, funding and service provision, resulting in woman having to  
27 “turn to different systems than the formalized system” such as “couch surfing” with families,  
28 friends and often with unknown men. While one provider found women’s ability to seek  
29 alternative routes as “resourceful”, most voiced the opinion that the lack of shelter or emergency  
30 housing for women increased their vulnerability. For example, women with SMI would “trade  
31 sex for somewhere to stay” and “take somebody [in an exploitative context] in to help them pay  
32 the rent when they’re feeling under pressure because of the costs.” For the majority, this was a  
33 question of powerlessness rather than one of resourcefulness.

46  
47

48 “Women’s [with SMI] homelessness tends to be a little bit more invisible. We certainly  
49 have a number of women who have lived with their sister for a long time or crashed with  
50 unsavory males over a series of years. They have, in fact, been homeless they have just  
51 been temporarily couched. If you look at resource availability...they operate out of men’s  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 shelters, and aren't always in a safe environment for women. [Resources] certainly seem  
4  
5 to be centered on male-accessible places...all these guys have all these shelters to choose  
6  
7 from and if they get booted out of one after four weeks they just move over to the next  
8  
9 one. We turn hundreds and hundreds of women away from our shelter because we just  
10  
11 don't have the beds.”

12  
13 [Community service provider, small town in Central Canada]

14  
15 Women were described as being pushed into a vicious cycle of unstable housing and  
16  
17 increasingly stressful environments which led to poorer mental health, quality of life, and little  
18  
19 access to community services. This cycle was compounded in smaller towns, as women had to  
20  
21 leave for larger cities where there was better access to mental health and housing services.  
22  
23  
24  
25

26  
27 While men with SMI were described as having relatively greater access to housing and  
28  
29 shelter, and experiencing less victimization and sexual exploitation, they are in no way immune  
30  
31 to the dynamics of poverty and marginalization. They were described as typically being forced to  
32  
33 live in “drug infested” areas due to stigma and poverty. Living in such neighbourhoods leads to  
34  
35 high levels of anxiety among both men and women, and participants describe this as greatly  
36  
37 increasing the risk of a relapse.  
38  
39

#### 40 41 *The Intersection of Gender and Ethnicity*

42  
43 Belonging to an ethnic minority group acted as a further source of marginalization, not  
44  
45 just within hospital and community services but also within people's own ethnic groups. The  
46  
47 evidence of “blind spots” which fuelled gender and ethnic discrimination were evident mostly in  
48  
49 the experiences of women.  
50  
51

52  
53 “I'm thinking of one woman in particular who was from Pakistan and had been married  
54  
55 most of her life but recently divorced and found herself on her own and with no place to  
56  
57  
58  
59  
60

1  
2  
3 live. I remember taking her to the shelter just before Christmas and she walked in her  
4  
5 head scarf into this predominately male shelter waiting area and you could just feel it, it  
6  
7 was very striking the degree to which she didn't fit in."  
8  
9

10 [Community service provider, urban area in Northern Canada]

11  
12 For Aboriginal people living in rural Canada and the northern territories, the level of  
13  
14 discrimination experienced by women with SMI was described as particularly heightened.  
15  
16 Geography and location, intersecting with gender, ethnicity, and intergenerational trauma, meant  
17  
18 that women were trapped in situations compounded by lack of transportation and an inability to  
19  
20 leave town.  
21  
22  
23

24 "We worked with a woman from a small Aboriginal community. Her non-Aboriginal  
25  
26 husband got on the housing authority board and illegally had her name removed from  
27  
28 home ownership papers just because the government could. She didn't win, because even  
29  
30 lawyers are racist in the territories...so in small communities it is very controlled by men  
31  
32 and they will choose men over Aboriginal women...Aboriginal women are the most  
33  
34 marginalized."  
35  
36  
37

38 [Community service provider, small town in Northern Canada]

39  
40 In the Aboriginal service context, several participants noted a conflict between the  
41  
42 community and hospital sectors, in that "psychiatrists, psychologists, and nurses" who are  
43  
44 considered "mainstream" were not using a "culturally competent approach", which resulted in a  
45  
46 "racist" approach to care. These dissonances between community and hospital services created a  
47  
48 discontinuity in care and impeded the recovery of Aboriginal women. Providers talked about  
49  
50 how the "structural oppression" was internalized by women, who began to "talk about it like it's  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 their fault”, and used words such as “loser” and not having the “smarts or self control” to  
4  
5 improve their lives.  
6  
7

### 8 *Men, Perceptions of Risk, and Housing Quality*

9

10 While participants described the impact stigma had on both men and women, their  
11 narratives emphasized the manner in which it pervaded men’s experiences. They described how  
12 the level of “trouble” and “risk” perceived by providers seemed to shape the transitioning and  
13 access to community housing for men with severe mental illness. It was perceived as a “reality  
14 that men are more prone to violence” compared to women, who were often viewed as “easier  
15 tenants.”  
16  
17  
18  
19  
20  
21  
22  
23

24 “More men end up without housing because as part of their illness they’re maybe using  
25 more and tend to be more aggressive ... landlords are more afraid. I mean we definitely  
26 have women that have been quite agitated but I think landlords tend to be more accepting  
27 of females.”  
28  
29  
30  
31  
32

33  
34 [Hospital service provider, urban area in Western Canada]  
35

36 Participants also described men as being subjected to more substandard levels of  
37 accommodation, based on the perception that men “don’t care” about their homes and are  
38 content with living in “dorm-like situations”.  
39  
40  
41  
42

### 43 *Women, Children, and Families*

44

45  
46 There was a general perception across participant narratives that men with SMI seldom  
47 had family responsibilities. For men with children, this left them at a disadvantage – if they had a  
48 child they would have even greater difficulty in accessing suitable housing than their female  
49 counterparts. The majority of the commentary in this topic, however, revolved around women’s  
50 experiences. The presence of children created further complexity for women in the housing  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 system, oscillating between facilitating and hindering housing access, recovery, and community  
4 participation. Access was described as improved by some participants based upon “the premise  
5 that women, as child bearers, will require family housing.” Having children was also described  
6 by some as facilitating greater access to services as their physical and mental health needs are  
7 considered a priority by providers. Others, however, described women with children as having  
8 greater difficulty accessing care due to childcare responsibilities and fears that their  
9 circumstances of mental illness and victimization may lead to their children being taken into  
10 custody. Additional challenges included having adolescent male children who are not allowed in  
11 female-only housing and shelter settings, and “catch-22” scenarios that can make it nearly  
12 impossible for impoverished women to regain custody once it is lost.  
13

19  
20  
21  
22  
23  
24  
25

26  
27 “So when a woman applies for housing, if they don’t have guardianship they can only  
28 apply for a single even though they need a 3-bedroom to get their kids back...so maybe  
29 she will get a one bedroom and is living in an overcrowded situation again...living in that  
30 overcrowded place plays into the mental health of the parent and the children and that  
31 creates the tension and starts to stir the pot. Then throw some alcohol on that, and then  
32 starts the domestic violence, then she flees the violence, and the partner stays in the house  
33 and she has to start the process all over again.”  
34  
35

This study of housing expert perspectives was undertaken to describe the housing service context for Canadians with SMI as a function of gender. It is an initial attempt to articulate these issues in the Canadian context and advance the small, but growing knowledge base related to gendered experiences of serious mental illness.

This study highlighted several problems. While considered in the broadest sense, housing access problems were considered equivalent regardless of gender and geographic context, the types of barriers faced varied greatly. Biased perspectives regarding housing needs were described as leading to women with SMI being forced into exploitative and victimizing circumstances. Even when accommodating women, the emphasis on male-focused services was described as being alienating and potentially risky for women to access. These findings are reflective of literature that, while noting greater success with independent living among women<sup>7,8</sup>, also describe much higher rates of coercive sexual encounters and sex trade involvement<sup>13</sup>. Indeed, it brings forward the question of necessity in the greater levels of independence observed among women and whether, for many, purported observations of independence may overlie contexts of exploitation and victimization.

Additionally, while the many stresses that attend having a child for women with SMI have been documented<sup>18</sup>, this study noted several implications for housing-related services. These included ambivalence about the net impacts for mothers with SMI. Some participants cited enhanced outreach and support extended to mothers and others describing mothers having less time to access services or actively avoiding services for fear of losing custody. Fear of losing custody of children was associated with women being forced into higher-risk living circumstances. Women who had lost custody were also described as struggling with catch-22 scenarios in which they required adequate housing to regain custody but could not obtain it

1  
2  
3 unless they had custody. The issues attending custody and parenting are, however, quite complex  
4  
5 and were not fully addressed in this study. It is an area that would greatly benefit from further  
6  
7 inquiry that could more intensively examine the intersections (gender, ethnicity, geography) and  
8  
9 specific contexts (family versus individual homelessness) therein.  
10  
11

12  
13 Men were also described as facing significant problems accessing adequate housing,  
14  
15 albeit with some different factors involved. This was reflected in the finding men were  
16  
17 comparably rated with women in terms of overall access to housing services. Men with SMI  
18  
19 were understood to have difficulties accessing stable housing due to their being perceived as  
20  
21 being more prone to disturbance and violence. Furthermore, there existed a perception that men  
22  
23 cared less about the quality of housing and shelter spaces, resulting in their being provided with  
24  
25 lower quality and, more frequently, large dormitory-type spaces. These findings are reflected in  
26  
27 observation of greater rates of homelessness among males with SMI<sup>10</sup>.  
28  
29  
30  
31

32 While considered relatively rare, child custody was considered a pronounced challenge  
33  
34 for men as supports for families was described as almost exclusively geared towards single  
35  
36 parent women. This problem extended to women with teenaged male children who, if they  
37  
38 appeared too adult, were likely to be sent to separate shelters due to concerns that their presence  
39  
40 might disturb other female residents.  
41  
42

43  
44 Ethnicity and service sector size were generally described as compounding the housing  
45  
46 access problems faced by women. Consistent with previous work<sup>21</sup>, it was observed that  
47  
48 racialized women faced several forms of discrimination in male-oriented shelter and housing  
49  
50 systems. Provider concerns for Aboriginal women revolved around culturally inappropriate care  
51  
52 and the pronounced lack of access to housing and limited mobility that attend poverty in remote  
53  
54 communities – risks that are enhanced when political and service leadership structures are  
55  
56  
57  
58  
59  
60

1  
2  
3 predominantly male and equitable policy can be undermined through patriarchal implementation.  
4  
5 Such observations align with international debate and advocacy regarding human rights  
6  
7 violations against Aboriginal women<sup>24</sup>, violations that need to be understood within ongoing  
8  
9 practices and effects of colonialism. Conversely, some providers spoke of small Aboriginal  
10  
11 communities providing greater support to women with SMI, with grandparents and other family  
12  
13 members playing a greater role in care for children and housing when needed.  
14  
15

16  
17 While the transferability of these findings will require further study that integrates a  
18  
19 consideration of client perspectives and outcomes and extends beyond potential biases in the  
20  
21 sample (e.g., sample selection biases and the majority of participants being women), they point  
22  
23 to a need for a systematic examination of inequities in the Canadian housing service sector for  
24  
25 people with SMI. This group of Canadian housing experts observed structural forms of  
26  
27 discrimination that were compounded by poverty and mental illness within the context of an  
28  
29 ongoing pervasive difficulty in accessing adequate housing. As emphasized by Canada's mental  
30  
31 health strategy<sup>25</sup>, until gender and other key intersections such as ethnicity are better addressed  
32  
33 our services will continue to ignore major determinants of illnesses such as schizophrenia<sup>26,27</sup>.

## Abstract

Objective: This study was undertaken to examine the role of gender as it relates to access to housing among individuals with severe mental illness (SMI) in Canada.

Design: An exploratory, qualitative approach was used to assess the perspectives of Canadian housing experts. The focus of inquiry was upon the role of gender and associated intersections (e.g., ethnicity) in pathways to housing access and housing needs for individuals with SMI.

Setting: A purposeful sampling strategy was undertaken to access respondents across all Canadian geographic regions, with diversity across setting (urban and rural), and service sector (hospital-based and community-based).

Participants: Twenty nine individuals (6 male and 23 female) considered to be experts regarding their housing service context as it pertains to SMI were recruited. On average, participants had worked for 15 years in services that specialized in the support and delivery of housing services to people with SMI.

Measures: Semi-structured interviews with participants focused on the role gender plays in access to housing in their specific context. Barriers and facilitators were examined as were intersections with other relevant factors, such as ethnicity, poverty, and parenthood. Quantitative ratings of housing accessibility as a function of gender were also collected.

Results: Participants across geographic contexts described a lack of shelter facilities for women leading to a reliance on exploitative circumstances. Other findings included a compounding of discrimination for ethnic minority women, the unique resource problems faced in rural contexts, and the difficulties that attend access to shelter and housing for parents with SMI.

## Gender, Housing, and Severe Mental Illness 3

Conclusions: These findings suggest that, along with a generally poor availability of housing stock for individuals with SMI, access problems are compounded by a lack of attention to the unique needs and illness trajectories that attend gender.

## Article Summary

Article Focus:

- To understand the role of gender in housing access and needs among individuals with severe mental illness.

Key Messages:

- Misperceptions at policy and service system levels regarding the need for housing as a function of gender are leading to circumstances that compound the impacts of mental illness.
- Resource needs are particularly acute as additional points of marginalization emerge from factors such as ethnic minority status and rural context.
- Housing access problems have major impacts on the ability to parent as a person with severe mental illness.

Strengths and Limitations of this Study:

- This study is among the first to directly address the interplay between housing access and gender among individuals with severe mental illness.
- The study accesses a broad, national range of expert perspectives.
- Transferability to other national contexts outside of Canada needs clarification as do potential biases attending respondents (i.e., primarily female provider perspectives, no consumer perspectives represented).

## Gender, Housing, and Severe Mental Illness 4

- While serving the purpose of an initial inquiry, further work is needed to confirm and expand upon the assertions of the service providers interviewed here.

Acknowledgments: This work was supported by a grant from the Canadian Institutes of Health Research. Appreciation is also extended to Dr. John Trainor and the Toronto Community Support and Research Unit of the Toronto Centre for Addiction and Mental Health (CAMH) and Dr. Paula Goering, CAMH.

## Gender, Housing, and Severe Mental Illness 5

The lack of adequate and affordable housing for individuals with severe mental illness (SMI) is repeatedly highlighted in research, public, and policy discourses. It is a complex problem rooted in individual and structural factors. Individuals with SMI often present with a complex array of concurrent psychiatric and chronic medical conditions which are often compounded by poverty, social exclusion, and substance misuse. Many structural factors also contribute to a lack of good-quality housing for people with SMI. Rent is often unaffordable, with costs typically taking up 70-90% of an individual's public benefits. This problem is exacerbated by Canada having just over 25,000 supported housing units available<sup>1</sup>. As a result, over 500,000 Canadians with mental illness are inadequately housed and an estimated 120,000 are homeless<sup>1</sup>. This is a critical problem as adequate housing is a key determinant of health<sup>2</sup> and recovery<sup>3,4</sup>.

From research and practice perspectives, challenges arise in the very generic articulation of the housing problem for the SMI population. Considerations of the issue of housing have very seldom taken into account the intersections of resource and adversity that attend factors such as gender, race, and ethnicity. As long as the specific mechanisms by which such factors, and their intersections, remain poorly understood, housing policies and programs for people with mental illness will remain inefficient and ineffective<sup>5</sup>. It is in light of this shortcoming in the SMI

literature that the present study was undertaken to examine the role of gender in housing access for Canadians with SMI in Canada. This initial qualitative exploration draws upon housing expert perspectives regarding service access and service needs as they intersect with gender, ethnicity, and geographic context.

*Gender and Severe Mental Illness*

## Gender, Housing, and Severe Mental Illness 6

There are significant and pervasive differences between men and women with SMI that are present across the social determinants of health, illness onset and expression, and process of recovery. Taking schizophrenia as an example, women on average experience a later onset and less severe course of illness, though suffer more depressive symptoms than men<sup>6</sup>. A later onset of illness carries several important implications. Women typically have greater opportunities to establish a range of competencies and a higher degree of independence before the illness commences. This may account for generally stronger skills that support independent living and longer periods of community tenure<sup>7,8</sup>.

Women with SMI also have been found to more actively seek social contact and support, which may have implications for less dependence on service providers and greater success in living independently<sup>7,9</sup>. Men with SMI are, in turn, more likely to be homeless<sup>10</sup> and more reliant upon health services<sup>9</sup> which may account for a further deterioration of independent living skills<sup>11</sup>.

Women with SMI also face several unique and prominent sources of adversity. Women are more likely to have experienced childhood abuse and trauma and symptoms of PTSD<sup>12</sup>.

Women also experience higher rates of coercive sexual encounters and sex trade involvement as means of coping with poverty and homelessness<sup>13</sup>. [Coercion in relationships with male partners has also been extended to include influence upon the uptake of substance abuse and involvement in criminal activities<sup>14</sup>](#). Furthermore, women have a greater likelihood of having been socialized into passive and otherwise dependent roles, which may be reified through service providers working within models of care that cultivate dependency<sup>7</sup>. Such sociocultural factors are evident across a range of studies. For example, compared to women without SMI, those with SMI place a greater importance on having caring and compassionate providers than providers who

## Gender, Housing, and Severe Mental Illness 7

encourage choice and independence<sup>154</sup>. Women with SMI are also more likely to be perceived by family and other supports as more emotionally vulnerable and irrational in comparison to men<sup>165,176</sup>.

Pregnancy and child rearing is an additional consideration for women with SMI.

Typically framed in the context of enhancing risk, having a child has numerous implications around risks of medications in pregnancy and stressors associated with childrearing as poverty and illness threaten custody<sup>187</sup>. This is an increasingly relevant issue given evidence that the fertility rate among Canadian women with Schizophrenia is on the rise<sup>198</sup>.

Much less developed in the literature is attention to intersections of risk and resilience that attend the intersections of race, ethnicity, sexual and gender identity. Preliminary work suggests that these points of diversity have very important implications. While unique points of resilience emerge among these populations, recovery is typically complicated by multiple forms of discrimination and marginalization, and treatment needs that are seldom adequately met<sup>204,210</sup>.

#### *The Present Study*

Despite the consistent threads of evidence suggesting differences in mental illness etiology, expression, and recovery process as a function of gender, as a topic it is largely relegated to sidenote status in community mental health research and policy dialogues. This shortcoming is particularly evident in considerations of housing individuals with SMI. As such, this qualitative study was undertaken as an initial step to better articulating community service needs in Canada as a function of gender. Key informant interviews were undertaken with service providers across Canadian provinces and territories, in both hospital and community service sectors, and across both large urban, mid-sized city, and rural contexts.

## Methods

### *Recruitment*

In order to obtain a broad, national perspective on gender equity within the housing sector for people with SMI, service providers were sought in provinces and territories in all geographic regions. The recruitment strategy targeted balanced representation as a function of setting, with interviews conducted with providers working in the largest urban centres in Canada as well as representative small to mid-sized towns and cities. Representativeness of smaller centres was determined by a consensus of the urban providers (the inquiry starting point in each province/territory), seeking settings that were neither disproportionately over nor under-resourced. Balance was also sought in respondent service sector, seeking representation from both hospital-based and community-based organizations.

Participant eligibility relied primarily on their being regarded as an individual who is highly knowledgeable regarding access to housing and community services for people with SMI. Recruitment started in large urban centres, with participants recommended through sources such as key informants in the Mental Health Commission's recently completed consultation on housing and the At Home study. Large urban setting respondents were then asked to provide recommendations regarding experts in smaller settings. Recruitment continued until each region was adequately represented and qualitative themes had attained saturation with subsequent interviews revealing no new information. The study was reviewed and approved by [the Toronto Center for Addiction and Mental Health](#) institutional research ethics board (#183/2011).

### *Procedure*

Interviews lasting an average of 45 minutes were conducted with all participants via telephone and were audio-recorded and transcribed verbatim. Demographic data collected for

## Gender, Housing, and Severe Mental Illness 9

each participant included geographical location, type of service, number of years in current post, number of years working within mental health and housing sectors, gender, and profession. The interview then moved on to explore participant perspectives and experiences pertaining to differences regarding *access to, experiences within, and needs for* housing and associated resources as a function of gender.

The interview concluded with 2 items that were developed to quantify service provider perceptions regarding access to housing as a function of gender (e.g., In a broad, general sense, how accessible is affordable housing for women/men with SMI in your city/town?) Participants were asked to score each item using a 5 point likert scale where 1 represented 'completely inaccessible' and 5 represented 'completely accessible'. This scale was developed for this study as we were unable to identify an existing, validated tool for this purpose.

*Analysis*

While not a complete grounded theory design, the analysis followed the rigorous thematic analysis procedure outlined by Charmaz<sup>22,23</sup>, beginning with line by line coding of the data to pull out key, recurrent themes. Line by line coding was completed by 1 coder with category reports examined by a second research team member who also reviewed full transcripts and recordings of interviews. Coding was reviewed ~~with the research team~~ at ~~various several~~ stages of the analysis allowing for data to be contextualized and different interpretations explored and resolved through consensus. ~~Analysis then moved onto Ff~~ focused coding, where conceptual analysis took place, commenced after 8 interviews when coherent and consistent linkages between categories and themes began to emerge. and patterns amongst and relationships between the most relevant and salient categories became the focus. Emergent themes were shared in subsequent interviews for feedback and further exploration, which allowed for an

ongoing process of member checking and elaboration of the analysis. Quantitative data was examined descriptively with mean differences examined through independent samples t-test analysis.

## Results

### *Participants*

Twenty nine participants were recruited into the study (6 male and 23 female). All participants had worked within the mental health sector, ranging from between 1 to 30 years, with 20 years being the average length of service. Most worked in either director level or direct service positions, at 45 and 31 per cent respectively, with the remainder working in middle management. On average, participants had worked for 15 years in services that specialized in the support and delivery of housing services to people with SMI. Most were regulated professionals in areas such as Social Work or Counseling and 59 per cent were members of local advisory committees and boards related to housing. Table 1 provides a detailed summary of participant demographics.

### *Ratings of Accessibility*

Quantitative measures of participant perceptions regarding [global](#) housing access revealed a mean score for women of 2.0/5 (SD=0.68) and for men of 2.3/5 (SD=.86), a difference which was not statistically significant ( $t=1.53, p=.13$ ). Qualitative consideration of rating differences as a function of service sector (hospital versus community) and setting (large urban versus town/small city) revealed minimal difference for both women (difference of +/- 0.1) and men (difference +/- 0.3).

### *Qualitative Findings*

## Gender, Housing, and Severe Mental Illness 11

Participants uniformly regarded housing as the basic source of ‘stability’ and key health determinant that is equally relevant for men and women with SMI. Numerous, generic themes recurred such as the comments on low levels of housing stock, the limited availability and allocation of funding to develop and sustain adequate housing, and client difficulties in obtaining and maintaining adequate sources of income with which to cover rent and other basic expenses. Across service sectors and geographic region, the context of supporting individuals with SMI was described as one of pronounced financial strain.

Despite several cross-cutting similarities, these key-informant narratives of poverty, under-resourced housing service sectors, and stigma differed markedly as a function of gender, ethnicity, and other points of intersection. Erroneous assumptions about service needs and stigmatization were described as having a structural impact upon housing access. As will be described, this resulted in unique pathways of marginalization, victimization, and poverty.

*“Structural” Adversity: Cycles of Invisibility, Lack of Access, and Vulnerability*

Women were frequently referred to as the “invisible homeless”. Participants described how the perceived absence of homeless women and the perception of homeless men as more troublesome influenced policy, funding and service provision, resulting in woman having to “turn to different systems than the formalized system” such as “couch surfing” with families, friends and often with unknown men. While one provider found women’s ability to seek alternative routes as “resourceful”, most voiced the opinion that the lack of shelter or emergency housing for women increased their vulnerability. For example, women with SMI would “trade sex for somewhere to stay” and “take somebody [in an exploitative context] in to help them pay the rent when they’re feeling under pressure because of the costs.” For the majority, this was a question of powerlessness rather than one of resourcefulness.

“Women’s [with SMI] homelessness tends to be a little bit more invisible. We certainly have a number of women who have lived with their sister for a long time or crashed with unsavory males over a series of years. They have, in fact, been homeless they have just been temporarily couched. If you look at resource availability-...they operate out of men’s shelters, and aren’t always in a safe environment for women. [Resources] certainly seem to be centered on male-accessible places...all these guys have all these shelters to choose from and if they get booted out of one after four weeks they just move over to the next one. We turn hundreds and hundreds of women away from our shelter because we just don’t have the beds.”

[Community service provider, small town in Central Canada]

Women were described as being pushed into a vicious cycle of unstable housing and increasingly stressful environments which led to poorer mental health, quality of life, and little access to community services. This cycle was compounded in smaller towns, as women had to leave for larger cities where there was better access to mental health and housing services.

While men with SMI were described as having relatively greater access to housing and shelter, and experiencing less victimization and sexual exploitation, they are in no way immune to the dynamics of poverty and marginalization. They were described as typically being forced to live in “drug infested” areas due to stigma and poverty. Living in such neighbourhoods leads to high levels of anxiety among both men and women, and participants describe this as greatly increasing the risk of a relapse.

#### *The Intersection of Gender and Ethnicity*

Belonging to an ethnic minority group acted as a further source of marginalization, not just within hospital and community services but also within people’s own ethnic groups. The

## Gender, Housing, and Severe Mental Illness 13

evidence of “blind spots” which fuelled gender and ethnic discrimination were evident mostly in the experiences of women.

“I’m thinking of one woman in particular who was from Pakistan and had been married most of her life but recently divorced and found herself on her own and with no place to live. I remember taking her to the shelter just before Christmas and she walked in her head scarf into this predominately male shelter waiting area and you could just feel it, it was very striking the degree to which she didn’t fit in.”

[Community service provider, urban area in Northern Canada]

For Aboriginal people living in rural Canada and the northern territories, the level of discrimination experienced by women with SMI was described as particularly heightened. Geography and location, intersecting with gender, ethnicity, and intergenerational trauma, meant that women were trapped in situations compounded by lack of transportation and an inability to leave town.

“We worked with a woman from a small Aboriginal community. Her non-Aboriginal husband got on the housing authority board and illegally had her name removed from home ownership papers just because the government could. She didn’t win, because even lawyers are racist in the territories...so in small communities it is very controlled by men and they will choose men over Aboriginal women...Aboriginal women are the most marginalized.”

[Community service provider, small town in Northern Canada]

In the Aboriginal service context, several participants noted a conflict between the community and hospital sectors, in that “psychiatrists, psychologists, and nurses” who are considered “mainstream” were not using a “culturally competent approach”, which resulted in a

“racist” approach to care. These dissonances between community and hospital services created a discontinuity in care and impeded the recovery of Aboriginal women. Providers talked about how the “structural oppression” was internalized by women, who began to “talk about it like it’s their fault”, and used words such as “loser” and not having the “smarts or self control” to improve their lives.

#### *Men, Perceptions of Risk, and Housing Quality*

While participants described the impact stigma had on both men and women, their narratives emphasized the manner in which it pervaded men’s experiences. They described how the level of “trouble” and “risk” perceived by providers seemed to shape the transitioning and access to community housing for men with severe mental illness. It was perceived as a “reality that men are more prone to violence” compared to women, who were often viewed as “easier tenants.”

“More men end up without housing because as part of their illness they’re maybe using more and tend to be more aggressive ... landlords are more afraid. I mean we definitely have women that have been quite agitated but I think landlords tend to be more accepting of females.”

[Hospital service provider, urban area in Western Canada]

Participants also described men as being subjected to more substandard levels of accommodation, based on the perception that men “don’t care” about their homes and are content with living in “dorm-like situations”.

#### *Women, Children, and Families*

There was a general perception across participant narratives that men with SMI seldom had family responsibilities. For men with children, this left them at a disadvantage – if they had a

## Gender, Housing, and Severe Mental Illness 15

child they would have even greater difficulty in accessing suitable housing than their female counterparts. The majority of the commentary in this topic, however, revolved around women's experiences. The presence of children created further complexity for women in the housing system, oscillating between facilitating and hindering housing access, recovery, and community participation. Access was described as improved by some participants based upon "the premise that women, as child bearers, will require family housing." Having children was also described by some as facilitating greater access to services as their physical and mental health needs are considered a priority by providers. Others, however, described women with children as having greater difficulty accessing care due to childcare responsibilities and fears that their circumstances of mental illness and victimization may lead to their children being taken into custody. Additional challenges included having adolescent male children who are not allowed in female-only housing and shelter settings, and "catch-22" scenarios that can make it nearly impossible for impoverished women to regain custody once it is lost.

"So when a woman applies for housing, if they don't have guardianship they can only apply for a single even though they need a 3-bedroom to get their kids back...so maybe she will get a one bedroom and is living in an overcrowded situation again...living in that overcrowded place plays into the mental health of the parent and the children and that creates the tension and starts to stir the pot. Then throw some alcohol on that, and then starts the domestic violence, then she flees the violence, and the partner stays in the house and she has to start the process all over again."

[Community service provider, urban area in Northern Canada]

This problem was described as unfolding differently within some Aboriginal communities. For example, grandmothers were “rescuing” their grandchildren while mothers were “couch surfing” and “people take in their adult children and adult grandchildren”.

#### Discussion

This study of housing expert perspectives was undertaken to describe the housing service context for Canadians with SMI as a function of gender. It is an initial attempt to articulate these issues in the Canadian context and advance the small, but growing knowledge base related to gendered experiences of serious mental illness.

This study highlighted several problems. While considered in the broadest sense, housing access problems were considered equivalent regardless of gender and geographic context, the types of barriers faced varied greatly. Biased perspectives regarding housing needs were described as leading to women with SMI being forced into exploitative and victimizing circumstances. Even when accommodating women, the emphasis on male-focused services was described as being alienating and potentially risky for women to access. These findings are reflective of literature that, while noting greater success with independent living among women<sup>7,8</sup>, also describe much higher rates of coercive sexual encounters and sex trade involvement<sup>13</sup>. Indeed, it brings forward the question of necessity in the greater levels of independence observed among women and whether, for many, purported observations of independence may overlie contexts of exploitation and victimization.

Additionally, while the many stresses that attend having a child for women with SMI have been documented<sup>187</sup>, this study noted several implications for housing-related services. These included ambivalence about the net impacts for mothers with SMI. Some participants cited enhanced outreach and support extended to mothers and others describing mothers having less

## Gender, Housing, and Severe Mental Illness 17

time to access services or actively avoiding services for fear of losing custody. Fear of losing custody of children was associated with women being forced into higher-risk living circumstances. Women who had lost custody were also described as struggling with catch-22 scenarios in which they required adequate housing to regain custody but could not obtain it unless they had custody. The issues attending custody and parenting are, however, quite complex and were not fully addressed in this study. It is an area that would greatly benefit from further inquiry that could more intensively examine the intersections (gender, ethnicity, geography) and specific contexts (family versus individual homelessness) therein.

Men were also described as facing significant problems accessing adequate housing, albeit with some different factors involved. This was reflected in the finding men were comparably rated with women in terms of overall access to housing services. Men with SMI were understood to have difficulties accessing stable housing due to their being perceived as being more prone to disturbance and violence. Furthermore, there existed a perception that men cared less about the quality of housing and shelter spaces, resulting in their being provided with lower quality and, more frequently, large dormitory-type spaces. These findings are reflected in observation of greater rates of homelessness among males with SMI<sup>10</sup>.

While considered relatively rare, child custody was considered a pronounced challenge for men as supports for families was described as almost exclusively geared towards single parent women. This problem extended to women with teenaged male children who, if they appeared too adult, were likely to be sent to separate shelters due to concerns that their presence might disturb other female residents.

Ethnicity and service sector size were generally described as compounding the housing access problems faced by women. Consistent with previous work<sup>219</sup>, it was observed that

1  
2  
3  
4  
5  
6  
7  
8  
9 racialized women faced several forms of discrimination in male-oriented shelter and housing  
10 systems. ~~Provider c~~Concerns for Aboriginal women ~~with SMI~~ revolved around culturally  
11 inappropriate care and the pronounced lack of access to housing and limited mobility that attend  
12 poverty in remote communities – risks that are enhanced when political and service leadership  
13 structures are predominantly male and equitable policy can be undermined through patriarchal  
14 implementation. Such observations align with international debate and advocacy regarding  
15 human rights violations against Aboriginal women<sup>24</sup>, violations that need to be understood  
16 within ongoing practices and effects of colonialism. -Conversely, some providers spoke of small  
17 Aboriginal communities providing greater support to women with SMI, with grandparents and  
18 other family members playing a greater role in care for children and housing when needed.

25  
26  
27

28 While the transferability of these findings will require further study that ~~includes~~  
29 integrates a ~~closer~~ consideration of client perspectives and outcomes and extends beyond  
30 potential biases in the sample (e.g., sample selection biases and the majority of participants being  
31 women), the present findings they point to a need for a systematic examination of inequities in  
32 the Canadian housing service sector for people with SMI.- This group of Canadian housing  
33 experts observed structural forms of discrimination that were compounded by poverty and  
34 mental illness within the context of an ongoing pervasive difficulty in accessing adequate  
35 housing. As emphasized by Canada's mental health strategy<sup>253</sup>, until gender and other key  
36 intersections such as ethnicity are better addressed our services will continue to ignore major  
37 determinants of illnesses such as schizophrenia<sup>264,275</sup> .

Gender, Housing, and Severe Mental Illness 24

For peer review only

STROBE Statement—Checklist of items that should be included in reports of *cross-sectional studies*

	Item No	Recommendation
<b>Title and abstract</b>	√	(a) Indicate the study's design with a commonly used term in the title or the abstract (b) Provide in the abstract an informative and balanced summary of what was done and what was found
<b>Introduction</b>		
Background/rationale	√	Explain the scientific background and rationale for the investigation being reported
Objectives	√	State specific objectives, including any prespecified hypotheses
<b>Methods</b>		
Study design	√	Present key elements of study design early in the paper
Setting	√	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection
Participants	√	(a) Give the eligibility criteria, and the sources and methods of selection of participants
Variables	√	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable
Data sources/ measurement	√	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group
Bias	√	Describe any efforts to address potential sources of bias
Study size	√	Explain how the study size was arrived at
Quantitative variables	√	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why
Statistical methods	√	(a) Describe all statistical methods, including those used to control for confounding (b) Describe any methods used to examine subgroups and interactions (c) Explain how missing data were addressed (d) If applicable, describe analytical methods taking account of sampling strategy (e) Describe any sensitivity analyses
<b>Results</b>		
Participants	√	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed (b) Give reasons for non-participation at each stage (c) Consider use of a flow diagram
Descriptive data	√	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders (b) Indicate number of participants with missing data for each variable of interest
Outcome data	√	Report numbers of outcome events or summary measures
Main results	n/a	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included (b) Report category boundaries when continuous variables were categorized (c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period
Other analyses	n/a	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses

<b>Discussion</b>		
Key results	√	Summarise key results with reference to study objectives
Limitations	√	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias
Interpretation	√	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence
Generalisability	√	Discuss the generalisability (external validity) of the study results
<b>Other information</b>		
Funding	√	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based

\*Give information separately for exposed and unexposed groups.

**Note:** An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). Information on the STROBE Initiative is available at [www.strobe-statement.org](http://www.strobe-statement.org).
