

**Supplementary Figure S2. Ydj1 is approximately 100 times more abundant than Apj1 and Xdj1.** (A, B,C) Indicated amounts (OD<sub>600</sub>) of total protein isolated from wild-type, or the indicated mutant, yeast cells and purified Ydj1, Xdj1 or Apj1 (ng) were resolved by electrophoresis, electro-blotted and probed with antibody specific for one of the J-proteins, as indicated. Blots were scanned and densitometric quantification was performed using ImageJ software. (A) only wt lysates. (B) lysates from *xdj1*Δ, wild-type (WT) and *xdj1*Δ cells expressing pRS414-*ADH-Xdj1* (*ADH-Xdj1*). All samples were run on a single gel and blotted and processed together. Dashed line indicates where irrelevant lanes were spliced out. C) wild-type (WT) or *apj1*Δ yeast. Levels of protein in wt cells, estimated as described in Ghaemmaghami et al, 2003, were approximately 90,000, 500 and 100 molecules/cell of Ydj1, Xdj1 and Apj1, respectively. The estimates reported by Ghaemmaghami et al, 2003 using tagged protein in a high throughput analysis were 119,000, 1210 and 125 molecules/cell.
