CONTENTS

Supplementary Figures 1 to 3

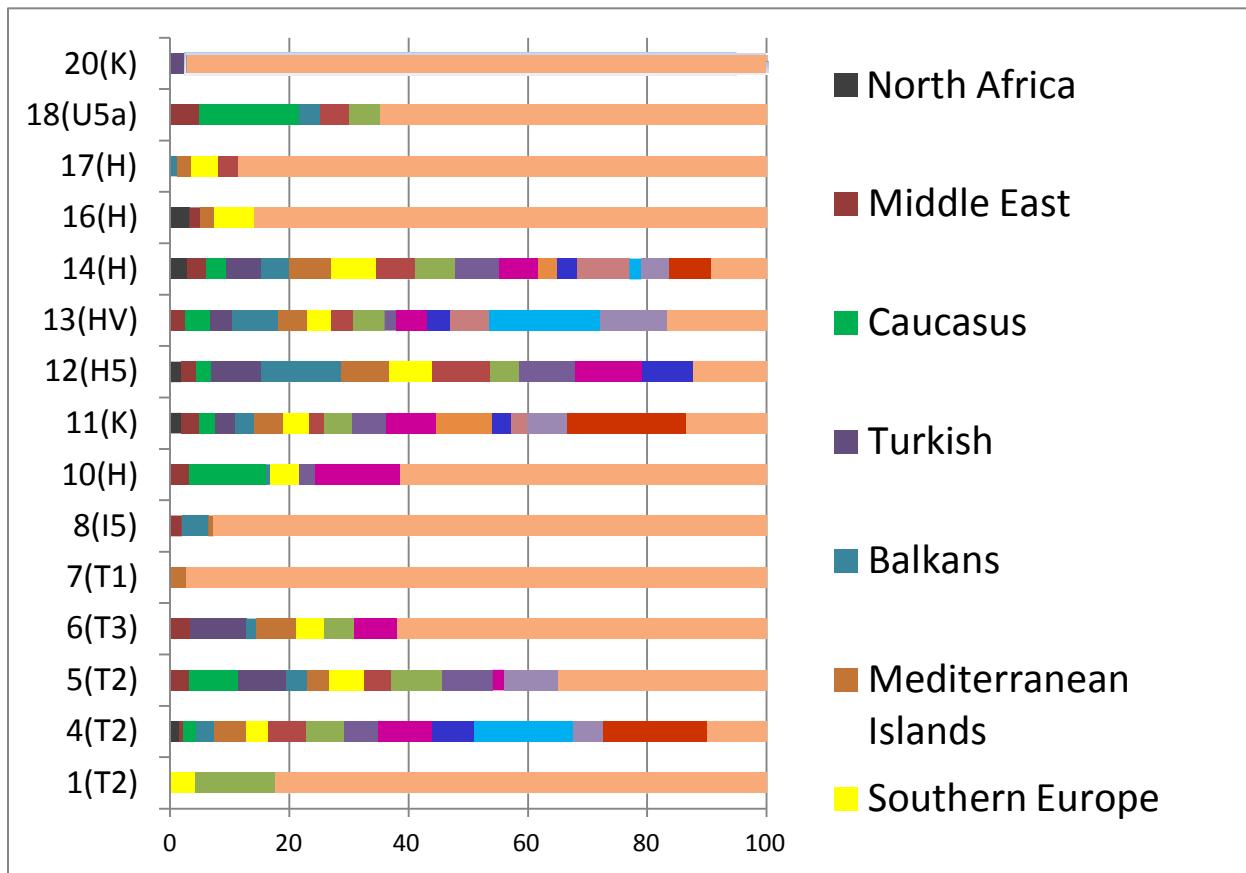

Supplementary Tables 1 to 7

Supplementary Figure S1. Geographical interpolation of shared mtDNA HVS-1 lineages. The blue gradient represents the percentage of shared lineages for Minoan haplotypes. The higher percentages are represented in blue and the lower are in white. Six of the 17 Minoan lineages are private and are not shown in suppl. Figures 1 and 2 (haplotypes 2, 3, 9, 15, 19, 21). Crosses denote the location of populations used in this analysis. **A**, sharing with ancient populations; **B**, haplotype 1 shared with 3 populations; **C**, haplotype 4 shared with 40 populations; **D**, haplotype 5 shared with 37 populations; **E**, haplotype 6 shared with 12 populations; **F**, haplotype 7 shared with 1 population; **G**, haplotype 8 shared with 8 populations; **H**, haplotype 10 shared with 10 populations

Supplementary Figure S2. Geographical interpolation of shared mtDNA HVS-1 lineages. The blue gradient represents the percentage of shared lineages for Minoan haplotypes. The higher percentages are represented in blue and the lower are in white. Crosses denote the location of populations used in this analysis. A, haplotype 1 shared with 63 populations; B, haplotype 12 shared with 50 populations; C, haplotype 13 shared with 61 populations; D, haplotype 14 shared with 82 populations; E, haplotype 16 shared with 6 populations; F, haplotype 17 shared with 4 populations; G, haplotype 18 shared with 13 populations; H, haplotype 20 shared with 1 population.

Supplementary Figure S3. Minoan haplotypes are rarely observed outside Europe. Distribution of Minoan haplotypes across different geographic regions and eras. Considering the occurrences of each Minoan haplotype across our entire dataset (Minoans, 71 extant populations and 11 additional ancient populations) the percentage of each haplotype per studied geographic region and era is shown. Populations are grouped here in broad geographic regions and eras (Table S4). Six Minoan haplotypes were private to the Minoans and are not shown (Table S2).

Supplementary Table S1. Authentication of Results

Lassithi cave samples compliant with all precautionary ancient DNA criteria	69
Samples that completely failed to amplify	7
Samples that failed to amplify with all primers	5
Samples with non-reproducible sequencing results	5
Samples with reproducible HVS-1 sequencing results	52
Submitted to DNA extraction and genomic sequencing by a different UW lab and different personnel	52
HVS-1 sequencing not confirmed by genomic sequencing	2
HVS-1 sequences were not present in the DNA submitted to genomic sequencing	13
Samples in which the results of HVS-1 sequencing were verified by genomic sequencing and used in statistical analysis	37

Confirmation and authentication of sequencing results on DNA extracted from teeth of craniums found in the Lassithi Cave of Ayios Charalambos.

Supplementary Table S2. Haplotype Designation for 37 Minoans.

mtDNA Hypervariable Sequence 1 region motifs, mtDNA genome sequencing, and haplotype designations for 37 Minoans. Mutations in bold represent deamination events. In all 37 individuals there was correspondence between HVS 1 sequencing and genome sequencing. Only haplotype defining mutations are noted in the above Table. CRS: Cambridge Reference Sequence; Letters AH, H and the symbol # denote three different groups of Minoans.

mtDNA SNPs based on a comparison to the CRS as determined from the genome sequencing analysis of 52 Minoans performed at the University of Washington, Seattle. "()" indicates another nucleotide present in 1 or more 36 mer. In black are the 37 cases in which the HVS-1 sequencing was confirmed by the next generation genomic sequencing. In red color are 13 cases in which HVS-1 sequencing was not confirmed by genomic sequencing because of absence of HVS1 fragments in the sequenced DNA. In blue are two cases in which the genomic sequencing did not confirm the HVS1 sequencing.

Supplementary Table S4: Populations compared with the 37 Minoan samples.

In our analysis, we consolidated individuals from the modern populations to the population groups shown in the second column, by grouping together individuals from the same ethnic group. Sample sizes and references for each of the 135 original populations are shown. Greek populations were not consolidated in order to better explore their affinity to the Minoans.

The first column of the table indicates the number of the haplotype (out of 21 distinct haplotypes observed in the 37 Minoan samples), the second column indicates the haplogroup, the third column indicates a population where the haplotype appears, and the fourth column indicates the haplotype frequency in the respective population (out of 100%).
