## Synthesis

NMOA, NEOA, NHMA and NMMA were synthesized through nucleophilic addition of appropriate amines (**3a-d**) to a protected ornithine thiourea (**2**, Scheme S1).<sup>1,2</sup> MHA was synthesized according to Clement and coworkers.<sup>3</sup>

**Scheme S1.** Synthesis of NHA Analogs NMOA, NEOA, NHMA, NMMA.

## General Synthetic Materials and Methods

CbzNCS was prepared according to the procedure of Martin *et al.*<sup>1</sup> *N*-Boc-L-ornithine *tert*-butylester hydrochloride (**1**) was purchased from Bachem, methoxylamine-[<sup>14</sup>C]-hydrochloride (34 mCi/mmol) was purchased from American Radiolabeled Chemicals. All other reagents were commercially available (Sigma Aldrich) and were used without further purification. Analytical thin layer chromatography was visualized by ultra violet light and/or ninhydrin stain. <sup>1</sup>H and <sup>13</sup>C NMR spectra were recorded in CDCl<sub>3</sub> or D<sub>2</sub>O on a 500 or 125 MHz spectrometer, respectively. Chemical shifts are reported as δ values in parts per million with the CDCl<sub>3</sub> and D<sub>2</sub>O peaks set at 7.26 and 4.80 ppm, respectively for <sup>1</sup>H spectra. <sup>13</sup>C spectra were referenced to CDCl<sub>3</sub> at δ 77.0 ppm High-resolution mass spectra were obtained using an Agilent 6210 ToF-LC/MS mass spectrometer; analyses were performed in the positive ion ESI mode.

### ***N*<sup>α</sup>-Benzyloxycarbonyl-*N*<sup>α</sup>-*tert*-butyloxycarbonyl-L-thiocitrulline *tert*-Butyl Ester (2)**

*N*<sup>α</sup>-*tert*-Butyloxycarbonyl-L-ornithine *tert*-butyl ester hydrochloride (**1**, 400 mg 1.4 mmol) was dissolved in anhydrous CH<sub>2</sub>Cl<sub>2</sub> (20 mL). DIEA (0.28 mL, 1.6 mmol) was added to obtain the free base. The flask was cooled to 0 °C and 4.0 mL of a 0.5 M solution of CbzNCS in CH<sub>2</sub>Cl<sub>2</sub> was added dropwise over 30 minutes. The mixture was further stirred for 2 hours while warming to room temperature. The reaction was washed with 1 % HCl (25 mL), H<sub>2</sub>O (25 mL) and brine (25 mL). The organic phase was dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated. The crude material was purified by column chromatography (hexanes:EtOAc 4:1, R<sub>f</sub> = 0.45) to obtain a yellow oil (540 mg, 90 %). <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>): δ = 1.45 [s, 9 H, C(CH<sub>3</sub>)<sub>3</sub>], 1.47 [s, 9 H, C(CH<sub>3</sub>)<sub>3</sub>], 1.70-1.85 (m, 4 H, β,γ-CH<sub>2</sub>), 3.66 (m, 2 H, NCH<sub>2</sub>), 4.22 (m, 1 H, α-CH), 5.10 (m, 1 H, NH), 5.12 (s, 2 H, CH<sub>2</sub>Ph), 7.38 (m, 5 H, ArH), 8.11 (br s, 1 H, NHCbz), 9.67 (br s, 1 H, NHBoc). <sup>13</sup>C NMR (500 MHz, CDCl<sub>3</sub>): δ = 24.2 (γ-CH<sub>2</sub>), 28.1 [C(CH<sub>3</sub>)<sub>3</sub>], 28.4 [C(CH<sub>3</sub>)<sub>3</sub>], 30.3 (β-CH<sub>2</sub>), 45.2 (NCH<sub>2</sub>), 53.6 (α-CH<sub>2</sub>), 68.2 (CH<sub>2</sub>Ph), 79.8 [C(CH<sub>3</sub>)<sub>3</sub>], 82.2 [C(CH<sub>3</sub>)<sub>3</sub>], 128.4, 128.6, 128.8 (ArCH), 134.6 (ArC), 152.5 (thiourea-C), 155.4 (CO-Boc), 171.5 (CO<sub>2</sub>-*t*-Bu), 179.0 (CO-Cbz).

### **General Method for Preparation of Protected NHA Analogs (4a-d)<sup>1,2</sup>**

To a solution of EDC (1.5 eqv) and thiourea (**2**) (0.5 mmol) in anhydrous CH<sub>2</sub>Cl<sub>2</sub> (5 mL), was added a mixture of DIEA (1.5 eqv) and the amine hydrochloride (**3a-d**, 3.0 eqv) in 5 mL of CH<sub>2</sub>Cl<sub>2</sub>. The reactions were stirred overnight at room temperature. The organic phase was washed with 1 % HCl (10 mL), H<sub>2</sub>O (10 mL) and brine (10 mL). The organic phase was dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated. The resulting oils were purified by column chromatography.

***N<sup>α</sup>-tert-butylcarbonyl-N<sup>ω</sup>-Benzyloxycarbonyl-N<sup>ω'</sup>-methoxy-L-arginine tert-Butyl Ester (4a)***

Amine (**3a**) = methoxyamine hydrochloride; eluent: hexanes:EtOAc (4:1);  $R_f = 0.3$ ; yield 93%, colorless oil.  $^1\text{H NMR}$  (500 MHz,  $\text{CDCl}_3$ ):  $\delta = 1.46$  [s, 9H,  $\text{C}(\text{CH}_3)_3$ ], 1.48 [s, 9H,  $\text{C}(\text{CH}_3)_3$ ], 1.72-1.87 (m, 4H,  $\beta,\gamma\text{-CH}_2$ ), 3.13 (m, 2H,  $\text{NCH}_2$ ), 3.68 (s, 3H,  $\text{OCH}_3$ ) 4.21 (m, 1H,  $\alpha\text{-CH}$ ), 5.16 (m, 1H, NH), 5.17 (s, 2H,  $\text{CH}_2\text{Ph}$ ), 6.29 (m, 1H NH), 7.40 (m, 5H, ArH), 7.95 (br s, 1 H NHBoc).  $^{13}\text{C NMR}$  (125 MHz,  $\text{CDCl}_3$ ):  $\delta = 24.9$  ( $\gamma\text{-CH}_2$ ), 28.1 [ $\text{C}(\text{CH}_3)_3$ ], 28.4 [ $\text{C}(\text{CH}_3)_3$ ], 30.2 ( $\beta\text{-CH}_2$ ), 40.6 ( $\text{NCH}_2$ ), 53.8 ( $\alpha\text{-CH}_2$ ), 61.4 ( $\text{OCH}_3$ ), 67.7 ( $\text{OCH}_2\text{Ph}$ ), 79.6 [ $\text{C}(\text{CH}_3)_3$ ], 81.9 [ $\text{C}(\text{CH}_3)_3$ ], 128.4, 128.6, 128.7 (ArCH), 135.1 (ArC), 148.2, 152.9 (guanidine-C, CO-Cbz), 155.4 (CO-Boc), 171.8 ( $\text{CO}_2\text{-}t\text{-Bu}$ ).

Amine (**3d**) = *N,O*-dimethylhydroxylamine hydrochloride; eluent: 5% MeOH in CH<sub>2</sub>Cl<sub>2</sub>; R<sub>f</sub> = 0.28; yield 95%, colorless oil. <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>): δ = 1.44 [s, 9H, C(CH<sub>3</sub>)<sub>3</sub>], 1.46 [s, 9H, C(CH<sub>3</sub>)<sub>3</sub>], 1.65 -1.80 (m, 4H, β,γ-CH<sub>2</sub>), 3.12 (s, 3H, NCH<sub>3</sub>) 3.30 (m, 2H, NCH<sub>2</sub>), 3.66 (s, 3H, OCH<sub>3</sub>) 4.16 (m, 1H, α-CH), 5.14 (m, 1H, NH), 5.10 (s, 2H, CH<sub>2</sub>Ph), 7.32 (m, 5H, ArH). <sup>13</sup>C NMR (125 MHz, CDCl<sub>3</sub>): δ = 25.3 (γ-CH<sub>2</sub>), 28.0 [C(CH<sub>3</sub>)<sub>3</sub>], 28.3 [C(CH<sub>3</sub>)<sub>3</sub>], 30.3 (β-CH<sub>2</sub>), 38.5 (NCH<sub>2</sub>), 42.6 (NCH<sub>3</sub>), 53.5 (α-CH<sub>2</sub>), 60.8 (OCH<sub>3</sub>), 66.8 (OCH<sub>2</sub>Ph), 79.7 [C(CH<sub>3</sub>)<sub>3</sub>], 82.1 [C(CH<sub>3</sub>)<sub>3</sub>], 127.6, 127.8, 128.2 (ArCH), 137.6 (ArC), 152.8, 155.4 (guanidine-C, CO-Cbz), 160.4 (CO-Boc), 171.6 (CO<sub>2</sub>-*t*-Bu).

**General Procedure for NHA Analogs (5a-d)**

To protected NHA analogs (**4a-d**) dissolved in 20 mL MeOH was added Pd/C (10 mol %). The flask was sealed then purged and flushed three times with H<sub>2</sub>. The reaction was stirred under H<sub>2</sub> atmosphere for two hours. The reaction was then filtered through a pad of Celite, rinsing thoroughly with MeOH. Solvent was removed in vacuo and the intermediates were redissolved

in 4 M aqueous HCl. Intermediates were stirred for two hours at room temperature and solvent and HCl was removed in vacuo.

## <sup>14</sup>C-NMOA experiments

**Figure S10.** HPLC Chromatographs of iNOS-[<sup>14</sup>C]-NMOA Reactions Analyzed at 460 nm and by <sup>14</sup>C-Scintillation Counting.

**(A)** A control NDA-derivatization of [<sup>14</sup>C]-NMOA stock solution was separated by HPLC with detection at 460 nm and one minute fractions were collected and <sup>14</sup>C counted. These spectra show that all <sup>14</sup>C elutes at 11.7 minutes, indicating there are no <sup>14</sup>C-containing contaminants eluting elsewhere from the column.

**(B)** NDA-derivatization of the [<sup>14</sup>C]-NMOA iNOS reaction was separated by HPLC, fraction-collected and scintillation-counted. These spectra show early fractions (2-4 minutes) contain <sup>14</sup>C. This low retention time, of what is presumably a one-carbon metabolite from the iNOS-[<sup>14</sup>C]-NMOA reaction, appropriately suggests it is highly polar. Remaining <sup>14</sup>C elutes at 11.7 minutes indicating it is unreacted NMOA. Turnover for this specific reaction analyzed was measured to be 19% by absorbance and 16% by <sup>14</sup>C detection. The peak at 4.2 minutes that absorbs at 460 nm is NDA-citrulline, confirmed by retention time as well as by mass spectrometry (see below and in main text).

(C) The [ $^{14}\text{C}$ ]-NMOA-iNOS reaction DNPH-derivatized and analyzed by HPLC separation with 360 nm detection and fraction collected for scintillation counting. In this case, nearly all  $^{14}\text{C}$  elutes very early. No significant  $^{14}\text{C}$  eluted at 13.6 minutes, the retention time DNPH-formaldehyde standards, indicating the one carbon metabolite of these reactions is not formaldehyde. There is, surprisingly, a large DNPH-formaldehyde peak that is detected at 360 nm that elutes at 13.6 minutes, as well as some unreacted DNPH eluting at 11.9 and 12.1 minutes (as expected). Upon further examination of all iNOS-substrate reactions, all reactions, even the substrate-free iNOS reaction, has a significant level (between 600-1000  $\mu\text{M}$ ) of background DNPH-formaldehyde detected by absorbance at 360 nm. The source of this background DNPH-formaldehyde has not been found but seems to be from the NOS enzyme itself. The mass of this peak from iNOS reactions has been confirmed to be DNPH-formaldehyde by mass spectrometry analysis (see below).

(D) DNPH-derivatized [ $^{14}\text{C}$ ]-NMOA-iNOS reactions incubated with MeOX. A DNPH-formaldehyde peak is present at 13.6 minutes by spectral detection at 360 nm, consisting of background formaldehyde as well as some [ $^{14}\text{C}$ ]-formaldehyde. The  $^{14}\text{C}$  eluting between 13 and 15 minutes corresponds to 4.6 % of the total  $^{14}\text{C}$ , but the [ $^{14}\text{C}$ ]-NMOA-iNOS reaction had 25 % turnover by measurement of NDA-citrulline. Incomplete conversion to [ $^{14}\text{C}$ ]-formaldehyde is expected because MeOX also catalyzes formaldehyde into formate, which would have a very low retention time.

(E) DNPH-derivatized [ $^{14}\text{C}$ ]-NMOA-iNOS reactions incubated with MeOX and FDH. From a total of 25% turnover (by measurement of NDA-citrulline)  $^{14}\text{C}$  can be accounted for as DNPH-formaldehyde (7.8 %),  $\text{CO}_2$  (12 %) and the missing 5.2% remains undetectable as formate.

## Crystal Structures

**Figure S11.** The  $F_o - F_c$  omit electron density map contoured at  $2.5 \sigma$  for the substrate analogues (and active site water) bound in rat nNOS: (A) NMOA; (B) NEOA; (C) NHMA; (D) NMMA; (E) MHA.

**Figure S12.** Crystal structure of tBuOArg in the nNOS active site. As expected, for bearing such a bulky substituent, the active site water is displaced.

**Figure S13.** HPLC chromatographs of NDA derivatized products of iNOS-NMOA (A) and iNOS-NHMA (B) reactions (citruilline), including an initial timepoint (1 min) and a timepoint after 1 h of reaction time. Phenylalanine is used as an internal standard.

# NMR Spectra of Final Products

## *N*<sup>0</sup>-Methoxy-L-arginine (5a), D<sub>2</sub>O

# *N*<sup>ε</sup>-Ethoxy-L-arginine (5b), D<sub>2</sub>O

173.179

157.631

72.989

53.441

40.232

27.162

23.638

12.433

*N*-ethoxy-L-arginine

**NEOA**

(deprotected with TFA, Present as TFA salt)

*N*<sup>ω</sup>-Hydroxy-*N*<sup>ω</sup>-methyl-L-arginine (5c), D<sub>2</sub>O

***N*<sup>ω</sup>-Methoxy-*N*<sup>ω</sup>-methyl-L-arginine (5d), D<sub>2</sub>O**
