Bernhard et al. 10.1073/pnas.1221721110

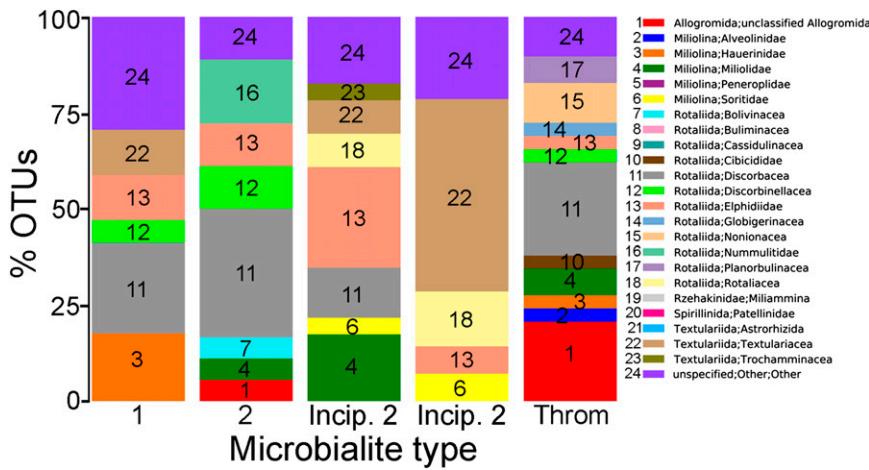

Fig. S1. Stacked bar graph showing taxonomic diversity of foraminifera, presented as percent operational taxonomic units (OTUs) for each taxonomic unit, in the 0- to 1-cm fraction of different Highborne microbialite types (1, stromatolitic type 1; 2, stromatolitic type 2; Incip. 2, incipient type 2 stromatolitic mat; throm, thrombolite). Unweighted diversity of operational taxonomic units (at 97% sequence similarity) revealed by Sanger clone libraries and foraminifera-specific primers.

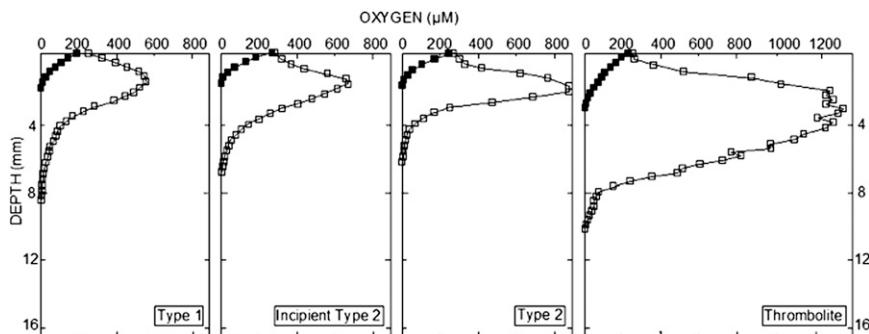

Fig. S2. Depth profiles of the oxygen concentrations in the four microbialite types studied for this investigation. Daytime readings (open symbols) were taken during peak photosynthesis (between 12:00 PM and 2:00 PM; light intensity ranged from $1,988$ to $2,104 \mu\text{E}\cdot\text{m}^{-2}\cdot\text{s}^{-1}$). Nighttime observations (closed symbols) were made at the end of the dark period (4:00–6:00 AM; light intensity was $0\text{--}0.01 \mu\text{E}\cdot\text{m}^{-2}\cdot\text{s}^{-1}$). From left to right are a type 1 stromatolitic mat, incipient type 2 stromatolitic mat, type 2 stromatolitic mat, and thrombolite mat.

Table S1. Species or taxon occurrences presented for the different microbialite samples, along with group-specific proportions and total densities

Sample	Stromatolite
