

Supplementary data

SUPPLEMENTARY FIG. S1. Characterization of hESC lines. Expression of hESC-specific markers analyzed by immunofluorescence microscopy. *SSEA-4* and alkaline phosphatase (AP) expression of H1 hESC line on *left* (10 \times) and *middle column* (4 \times), and *OCT4* expression of both H1 and H9 hESC lines in *right column*. Nuclei were counterstained with 4',6-diamidino-2-phenylindol (DAPI). All scale bars represent 500 μ m. hESC, human embryonic stem cell.
