* Lowercase primer sequences indicate homology to the amplified antibiotic marker used for knockout selection or the pTac promoter. Synonyms: Kan, kanamycin (as designed by [44]); tetR/A, tetracycline as designed by [46]. pTac: refers to the constitutive pTac promoter (116bp) [28] that was used for allelic replacement of the native *gtr* promoter.

** Lowercase primer sequences indicate sequence added to include restriction enzyme recognition sequence.
