

Figure S1.

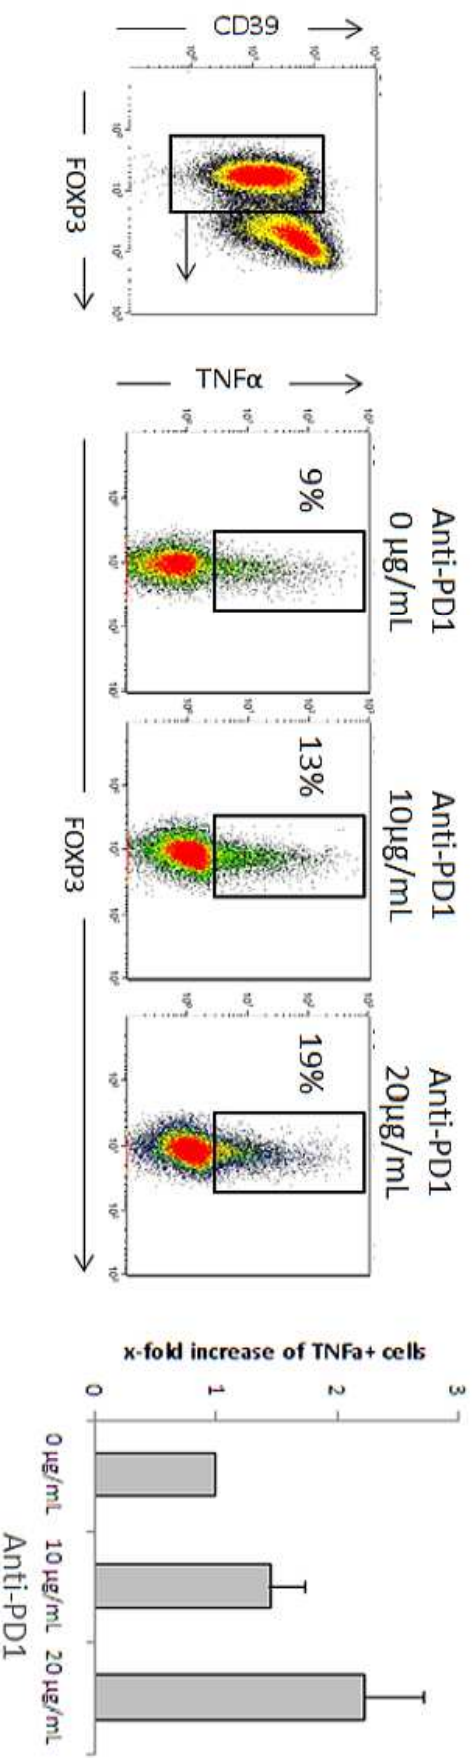

Figure S1. Effects of anti-PD1 antibody on cytokine expression. Expression of TNF- α in CD4⁺CD39⁺FOXP3^{neg} T cell subset was significantly increased in the presence of anti-PD-1 antibody as shown. CD4⁺CD39⁺ T cells were stimulated with SEB (1 μ g/ml) for 12 h and gates were set on CD4⁺CD39⁺FOXP3^{neg} T cells. Box plots show results from one representative experiment of two performed with bar graphs showing means \pm SD (* p < 0.04).
