

SUPPLEMENTARY FIG. S4. BMP7 decreased gene expression of ACC2 and displayed a consistent trend for increased gene expression of peroxisome proliferator-activated receptor gamma (PPAR γ). (A) ACC2 gene expression was significantly reduced at 24 h of BMP7 treatment. (B) ACC1 gene expression was not significantly changed at 24 h of BMP7 treatment. (C) PPAR γ showed a trend to be increased at 2, 4, and 24 h.
