This tables show all filter parameters (minimum number of x oligonucleotides and minimum log2ratio \pm 0.25/0.5) and the corresponding true positive and false positive rates (TPR and FPR). The calls were compared to the corresponding references with standard filter settings. Filtering regarding the number of oligonucleotides had no notable influence on TPR and FPR, while TPR dramatically decreased when filtering alterations in terms of log2ratio above -0.5/+0.5. The optimal filter setting is marked with an asterisk (*). minProbes = minimum number of oligonucleotides, minAvgAbsLogRatio = minimum absolute log2ratio.
