Mitochondria as a Target of Environmental Toxicants

Joel N. Meyer, Maxwell C.K. Leung, John P. Rooney, Ataman Sendoel, Michael O. Hengartner,
Glen E. Kisby, Amanda S. Bess

This Supplemental Table is a compilation of studies that have directly compared nDNA to mtDNA damage after chemical exposure, or by other means provided data supporting the importance of mtDNA damage for the toxicity of those chemicals (or, in a few cases, nonchemical stressors). Earlier (pre-1970) reports exist but are not included due to difficulties in interpreting earlier methodologies. Similarly, early reports comparing oxidative damage in mtDNA and nDNA before understanding the importance of artefactual oxidation during DNA isolation (Anson *et al.*, 2000) have not been included.
