

Figure S3. Expression of chemokines in PLNs of WT mice.

Frozen sections of PLNs were stained with polyclonal antibodies against CCL21, CCL19 or CXCL13 (*red*) and MECA-79 (*green*). Nuclear staining was performed with DAPI (*blue*). The profile of the fluorescence intensity along the white arrow in each merged image is shown on the right. Note that CCL21 but not the other chemokines accumulated in MECA-79-reactive HEVs. Scale bar, 50 μm . The data are representative of three independent experiments.
