^a Genes and proteins in the pHN1122-1 backbone were annotated by reference to R721 (GenBank accession no. AP002527) and by BLASTp searches, hyp presents genes encoding putative proteins. Genes used for phylogenetic analysis are shaded.

^b Amino acid identify was measured for each ORF of pHN1122-1 versus the respective ORFs of pFRIK2000 (NZ_ACXO01000104), pSH146_65 (JN983044), pChi7122-3 (FR851304), R721 (AP002527) and R64 (AP005147).

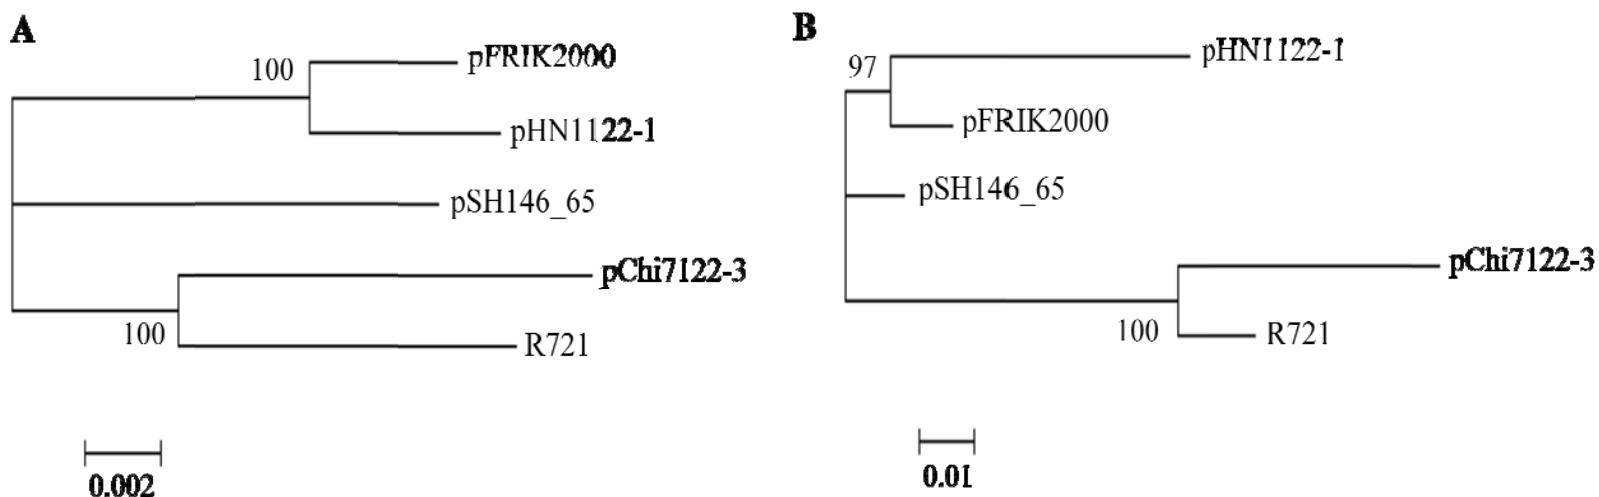

Figure S1. Phylogenetic alignment of 5 IncI2 plasmids. (A) The phylogeny was constructed in MEGA5 using the Neighbor-joining method from concatenated sequences of genes shared by all five IncI2 plasmids (Table S1). Bootstrap consensus trees were inferred using 500 replicates, with numbers at nodes representing percent correspondence. The scale bars represent the number of base substitutions per site. Sequences were obtained from the following GenBank accession nos.: R721, AP002527; pSH146_65, JN983044; pChi7122-3, FR851304; pFRIK2000, NZ_ACXO01000104; pHN1122-1, JN797501). (B) The phylogeny was constructed in MEGA5 using the Maximum Likelihood method from the entire sequences of the five IncI2 plasmids after removing any mobile elements. Bootstrap consensus trees were inferred using 500 replicates.
